this regard). In the aftermath of the Voting Rights Act of 1965, and subsequent court interpretations (see Guinier, 1991), some legislative districts have been designed to be minority dominated, in order to insure greater minority representation in the various legislative bodies. Because these districts are designed to contain a certain number of people, rather than a certain number of adult citizens, Mexican immigrants contribute to the electoral power of Mexican Americans by the weight of their sheer numbers. Because of the presence of so many Mexican immigrants, Mexican American districts have many fewer potential (and actual) voters than other districts. Table 1 shows that in the 1992 U.S. elections, people of Mexican descent (Mexican immigrants and Mexican Americans) cast only about 16 votes per hundred persons, while non-Hispanic Whites cast about 50 votes per hundred persons. The low number votes by persons of Mexican origin (Mexican immigrants and Mexican Americans) is due to a number of factors: younger population, lower citizenship rates, along with relatively low registration and voting rates, but the most important is the low adult citizenship rate of 54% as compared with 95% for non-Hispanic Whites and 92% for non-Hispanic blacks.

Mexican immigrants also may represent a cost to Mexican Americans if the presence of immigrants induces an anti-immigrant backlash in the non-Hispanic native population. Political organizations that serve the Mexican American community fought against IRCA in 1986 because they feared that a policy of employer sanctions that was intended to deter the employment of illegal Mexican immigrants might lead to wholesale discrimination against Mexican Americans and other Hispanic groups as well. IRCA also included an amnesty provision for long term undocumented residents, a provision which allowed more than 1.5 million Mexican immigrants to legalize their residence in the U.S., so the opposition of the Hispanic political organizations to IRCA ought to be viewed as evidence that immigrants are not the primary constituents of these U.S. based Hispanic organizations. Generally, if the anti-immigrant backlash takes on racial, ethnic, or discriminatory overtones, then such a backlash will necessarily make life more difficult for the non-immigrant coethnics (in this case Mexican Americans). Weintraub (1996) and Espenshade and Belanger (1996) take up such issues as California's Proposition 187, and other well known uses or abuses of the image of immigrants in U.S. popular politics.

Mexican immigrants are incorporated into life in the U.S. through communities or barrios that are already densely settled by Mexican Americans and other Mexican immigrants. In these barrios the Mexican American political organizations, civic organizations and elected officials constitute the local elites. As the Mexican American community has evolved politically over the last 30 years, and in particular as the Mexican Americans have become assimilated into routine electoral politics in the U.S., the nature of the barrios has changed. As the nature of the

barrios has changed, the political dynamics between the Mexican immigrants and the Mexican Americans has necessarily changed. In this paper I examine the trajectory of Mexican American politics, especially the growth of electoralism, and discuss how these changes may have effected the political dynamics between Mexican immigrants and Mexican Americans.

It is crucial to keep Mexican immigrants and Mexican Americans separate empirically and analytically, especially when studying political issues. Mexican immigrants have long been known to have the lowest levels of naturalization, and the most tenacious maintenance of their native language among all major immigrant groups in the U.S. The attachment of Mexican immigrants to American politics is, therefore relatively low. Surveys of political opinion have revealed that Mexican Americans have a surprisingly low level of political solidarity for immigration issues (see De la Garza et al, 1992). One cannot assume, therefore, that Mexican immigrants and Mexican Americans share a common political perspective, although some processes such as naturalization have undergone tremendous changes since 1994 such that the future political statuses of Mexican immigrants and Mexican Americans are hardly certain (see concluding sections).

Most studies that deal with the political assimilation of Mexican Americans, such as J. Garcia (1987), are methodologically individualistic, that is they address the assimilation of individual persons. In this paper, political assimilation is used the way it is used by Dahl (1961) to mean the political assimilation of minority groups, rather than the assimilation of individuals. The relevant part of Dahl's famous study of New Haven is the section that details the political incorporation of Irish immigrants in the 19th century. Dahl argues that ethnic identity politics and nationalistic politics are a transitional phase for minority groups; in the case of the Irish in New Haven these former immigrants and working class citizens came to hold a share of mainstream political power in the course of three or four generations.

Alvarez (1973) proposed, and M. T. García (1989) explored in greater depth a generational interpretation of recent Mexican American history that has proved to be quite influential. García refers to 1930-1950 generation as the Mexican American generation, and the 1960s as the Chicano generation. The Mexican American generation was typified mainly by assimilationist, legalistic organizations like LULAC (League of United Latin American Citizens), founded in 1929, which held its meetings in English and excluded Mexican nationals from membership. The Mexican American generation was succeeded by the radical Chicano generation of the 1960s.

M. T. García's analysis does not go past the Chicano generation. I. M. García (1996) attempts to fill the void in M. T. García's analysis by suggesting that the recent, post 1975 generation of Mexican Americans is the 'Hispanic generation.' Acuña (1988) refers to the current period as the 'age of the brokers,' by which he

means that since the mid 1970s Mexican American politics have been dominated by elites (businessmen, politicians, bankers) who mediate between the wider American power structure and the Mexican American community. One of the salient changes in Mexican American politics since the Chicano generation has been the growth of Mexican American electoral participation, especially the new presence of Mexican Americans at many levels of elected office. Using data on Hispanic surnamed officials in state legislatures, state executive offices, and the U.S. Congress, I show how Mexican Americans have undergone a quantum leap in electoral politics since 1970.

The emergence of Hispanics as an electoral force has been treated for the case of California (Browning, Marshall and Tabb, 1984; Guerra 1989; Guerra 1991). I extend the analysis to include the rest of the Southwestern U.S., and also offer some new ideas about how electoral representation ought to be measured. De la Garza et al (1982) notes that prior to 1965, there were hardly any Mexican American elected officials in all of the southwestern U.S, and further notes that at the time of publication Mexican Americans were still greatly underrepresented. This paper takes a somewhat different approach, by focusing on a transition from electoral insignificance to electoral significance. For the Mexican Americans in the southwestern U.S., this transition takes place in the 1970s (except in New Mexico, where it took place much earlier). The transition from electoral insignificance to electoral significance has important implications for how immigrant minority groups are assimilated into U.S. culture.

Methodology

The standard measure of electoral representation is the parity score (Robinson and Dye, 1978; Browning, Marshall and Tabb, 1984), which goes by a variety of different names in the literature, but consists simply of this: specific group percentage of total elected officials divided by the same specific group's percentage of total population. A group that makes up 12% of a state's population, but only 6% of that state's elected officials would have a parity score of 0.5.

$$\text{1.a Parity Score} = \frac{(\#\text{of Hispanic elected officials/Total \# of elected officials})}{(\#\text{of Hispanic persons/Total\# of persons})}$$

Or

$$\text{1.b Parity Score} = \frac{(\#\text{of Hispanic elected officials/Total \# of elected officials})}{(\#\text{of Hispanic adult citizens/Total\# of adult citizens})}$$

Because of the winner take all election format in the U.S., and because of the established preference of majority white voters for majority white candidates (Guinier, 1991), minority groups are almost always underrepresented (i.e., have parity scores of less than 1). Some authors, most notably Guinier (1991) have questioned the significance of increased numbers of minority elected officials, on the grounds that electoral representation does not guarantee real political gains for the minority group. Browning, Marshall, and Tabb (1984) have made the argument that minority groups may only enjoy the fruits of increased political power if their representatives are part of a governing coalition; clearly electoral representation is a necessary, but not by itself a sufficient condition for minority political empowerment.

Figure 1 shows the parity scores for Hispanic surnamed elected officials for the 5 states with the largest percentage of Mexican Americans (Arizona, California, Colorado, New Mexico, and Texas) from 1960 to 1995. The 1960 starting point is far enough back to capture the entire trajectory of Hispanic electoralism in every state except New Mexico. The universe of elected officials in each state is the following: state wide elected offices (governor, comptroller, lieutenant governor, etc.),´ state legislature (house and senate), U.S. congress and U.S. senate. Hispanic ethnicity of elected officials is determined by surname. Using surname to determine ethnicity is less efficient than individual self identification, but the U.S. census did not fully rely on self identification for Hispanic ethnicity until 1980 (Bean and Tienda, 1987), and national lists of Hispanic elected officials are only available after 1984 (NALEO, 1994 and Brimhall-Vargas, NALEO educational fund, personal communication). Surname identification is therefore the only consistent way to address Hispanic political representation over time, as pre 1984 studies have done (see Lemus, 1974). For the sake of consistency, the official U.S. census lists of Spanish surnames (U.S. Census 1960, U.S. Census 1970, see also Bean and Tienda 1987) were used to determine the Hispanic ethnicity of elected officials, so that whatever biases are built into the list of surnames essentially vanishes as a result of being in both the numerator and the denominator of the parity score[1]. The random error aspect of using Hispanic surname as a marker for Hispanic ethnicity is somewhat controlled by the use of large sample sizes in the political universe—the states average more than 15 Hispanic surnamed officials each by 1995, so the random misidentification of one or two officials does not does not alter the long term trends. Since the long term trends are precisely what are of interest here, the use of larger political universes[2] (larger, for instance, than Browning, Marshall and Tabb, 1984) serves to minimize the influence of the stochastic nature of individual election results.

The second element in the parity scores is the population denominator. In this case I take a different approach from the previous studies by using only adult

Figure 1. Hispanic Surnamed Elected Officials in the Southwestern U.S., 1960–1995

citizen population instead of total population. Only adult (over 18 years of age) citizens have the right to vote in the U.S. In a representative democracy, those who do not have the right to vote are not, strictly speaking, represented. Pachon (1991) describes the lack of rights that non-citizens face, and the problem that non-citizenship presents for Hispanic (especially Mexican American) political empowerment. Because the Mexican origin population includes so many immigrant non citizens (although this seems to be changing—see below), previous studies of political representation have overstated the under representation of Mexican Americans by including non-citizens among the minority population. In the studies of Black political representation (like Robinson and Dye, 1978),

very little bias is introduced by using total population instead of adult citizen population because whites and blacks have citizenship rates and age profiles that are very similar (see Table 1). The studies that have measured Hispanic political participation (Browning, Marshall and Tabb, 1984; Guerra 1989; Guerra 1991) have adopted this same strategy of using total population figures, without taking into account the large problem of non-citizenship, and the smaller problem of an Hispanic population that is younger, and therefore has more non voters than the wider society. The data for adult citizen populations comes from the Public Use Micro Samples of the 1960 and 1970 census, and the November Current Population Surveys of 1978-1992.[3]

Findings

California, Texas, New Mexico, Arizona, and Colorado form the dominantly Mexican Southwest[4]. Among these five states, all but New Mexico show a pattern of electoral emergence in the early to mid 1970s[5]. The timing of the emergence of Mexican American electoralism is consistent with de la Garza et al. (1982), as well as with the authors who have reported findings only on California (Browning, Marshall and Tabb, 1984; Guerra 1991). Crucial here is the identification of a general Mexican American entrance into electoral politics, what I will call the Mexican American electoral generation, starting in the early 1970s.[6]

What I endeavor to measure, in Figure 1, is the emergence of Hispanic electoralism, and more specifically Mexican American electoralism in the 5 Southwestern states. This emergence is judged by achievement of a steady level of electoral representation of at least 0.5 on the parity scale. This level corresponds roughly to Robinson and Dye's (1978) findings for the equilibrium level achieved by blacks in city politics in the U.S. Prior to 1970 there were a trickle of Hispanic elected officials. Early pioneers include Raymond Tellez, mayor of El Paso (elected in 1957—see M. Garcia 1989); Henry Gonzalez, congressman from Texas (elected 1960); Edward Roybal, congressman from California (elected 1962), and 'Los Cinco' who were elected to power in Crystal City, Texas in 1963 (see Shockley, 1974). The early pioneers are important historically, but what is more important sociologically is the achievement by a minority group of a steady and significant level of representation throughout the political system. This steady and significant level of electoral representation is both a marker of, and an engine for future political assimilation by the minority group.[7]

It is important to note from the parity scores of Arizona, California, Texas, and Colorado that the gains in Mexican American elected representation that occurred during the 1970s reached a new stable level by 1980. The idea of a new threshold is important: the parity levels (roughly 0.5 to 0.8) reached in Arizona, Colorado,

California and Texas by the end of the 1970s have declined somewhat since 1980 but remained greater than 0.5 for 15 years, and this is what justifies the identification of a distinct phase of Mexican American electoralism.

Discussion

Where are the historical antecedents and causes of the electoral generation? The 1975 extension of special protection under the Voting Rights Act to Hispanics (especially Mexican Americans in Texas—see Thernstrom, 1987) did not have important effects until the next period of decennial legislative redistricting, after 1980. Since Figure 1 shows that the crucial transition in Mexican American electoralism occurred before 1980, the transition cannot be due to the direct effects of the Voting Rights Act. In fact, both Thernstrom (1987) and Skerry (1993) point to the already developed state of Mexican electoralism in 1975 as evidence for their argument that Mexican Americans did not need the Voting Rights Act's substantial special protections. The comparison between the relatively developed state of Mexican American electoralism in 1975, and the abject exclusion of blacks from the electoral process in the American South in 1965 (the specific situation whose amelioration was the original goal of the Voting Rights Act in 1965) is instructive in this regard.

In order to address the origins of the electoral generation (and, by extension, its implications) I turn now to a more historical treatment of Mexican American politics. The starting point for this analysis is the generational view of Mexican American history introduced by Alvarez (1973), explored by García (1989), and implied by Acuña (1988), in which a Mexican American generation dominated by assimilationist organizations (like LULAC) in the 1950s is succeeded by a radical generation in the 1960s, and early 1970s which is in turn succeeded by a more assimilated, moderate period I call the electoral generation.

In its heyday (1968-1974) the Raza Unida Party (RUP) produced a stream of dedicated political cadres who helped to extend the reach of Mexican Americans into the electoral system in the U.S. These early forays into electoral politics included local elections in Crystal City, Texas and three races for governor of Texas. The first Mexican American political candidates in Illinois were both Chicano activists: John Chico in 1969 (see Acuña, 1988) and Rudy Lozano, a leader in the radical Chicano nationalist group CASA[8] (Centro de Acción Social Autónomo—see Taller de Estudios Comunitarios, n.d.) who was narrowly defeated in the Democratic primary for alderman in Chicago's 22nd ward in 1983. Other authors, including Guinier (1991) and Browning, Marshall and Tabb (1984) have noted that many of the first minority politicians have come from activist backgrounds.

Although the radicals played a crucial role in breaching electoral barriers, ironically the new electoral political strength proved to be a counter balance to the influence of the radicals, and groups like the RUP receded from prominence in the 1970s[9]. Ramsey Muñiz, the RUP candidate for governor of Texas got about 200,000 votes in 1972 and again in 1974. In 1978, with the RUP in disarray, their Texas gubernatorial candidate Mario Campean got only 15,000 votes (I. M. García, 1989). As the RUP lost influence, more moderate and mainstream political organizations, like Mexican American Democrats (MAD) stepped in to take their place.

In a classic account, Dahl (1961: 34) describes the emergence in 19th century New Haven of an ethnically based (mostly Irish) immigrant politics that challenged the patrician status quo in that city: "The very success of politicians who use the ethnic approach leads to the obsolescence of their strategy. As assimilation progresses, new unities and cleavages supersede the old...." Portes and Stepick (1993: 215) cite Dahl, and have made the same point with regards to Cuban politics in Miami: "... ethnic politics provides an effective vehicle for convergence because the achievement of political power socializes immigrants into the functioning of mainstream institutions and gives them the necessary 'voice' to feel that they are part of those institutions." Politically assimilationist organizations such as NALEO (National Association of Latino Elected and appointed Officials) and SWVRP (South West Voter Registration Project) were founded in the 1970s, around the time when Mexican American electoralism became entrenched, to register Mexican American citizens, and to promote the idea of civic and electoral participation to Mexican Americans. SWVRP was founded by Willie Velasquez, a former RUP activist (I. M. García, 1989).

The new Mexican American electoral elite face a number of structural barriers in their quest to further integrate their constituents into routine American electoral politics. One barrier is, of course, the continuing stream of new Mexican immigrants. As I noted earlier, Mexican American legislative districts have many fewer potential and actual voters than other districts. The presence of so many electorally non viable adults tends to dilute the community's interest in electoral politics, and limits the strength of the bond between the elected officials and their constituents. This situation, referred to by Skerry (1993: 249) somewhat hyperbolically as the problem of 'rotten boroughs' may increase Mexican Americans' cynicism about electoral politics, but I think it would be hard to demonstrate that Mexican American politicians are any more out of touch with their constituents than other politicians. A second argument that has sometimes been proposed is that Mexican Americans are passive and cynical about electoral politics because of lessons learned from decades of experience with bureaucratic authoritarianism in Mexico. There are, however, millions of immigrants in the U.S. from countries considerably less democratic than Mexico, so this argument may be less than convincing.

The transition to the electoral generation has produced gains, but it has also left gaps in the political avenues open to Mexican Americans. The radical Chicano organizations were much more inclusive of immigrants, both legal and undocumented, in their rhetoric and in their political organizing than is the current spectrum of electorally oriented Mexican American civic organizations. The transition to electoral politics has meant a change from politics based on ethnicity to politics based on U.S. citizenship. The absence of an effective, powerful Chicano nationalist organization (an absence which is a direct legacy of the electoral generation's success) has left the Mexican American community with weakened defenses against attacks, such as California's Proposition 187 which explicitly targeted undocumented Mexican immigrants and also raised the level of xenophobia high enough to represent a threat to Mexican Americans in California.

The enormous flow of immigrants from Mexico represents political benefits as well as costs to the Mexican American community. Since the immigrants of today are often the parents of the Mexican Americans of tomorrow, the current wave of immigration will be the driving force behind a dramatic expansion of the Mexican American electoral base early in the next century. This electoral expansion may have important consequences in the electoral balance of power between whites, blacks and other ethnic groups. Skerry (1993) argues that while Mexican American political organizations tend to identify themselves with a coalition of minority interests, Mexican Americans themselves are deeply ambivalent about their minority status. While Mexican American politicians in the U.S. congress tend to find much common ground with black congressional leaders (both groups are predominantly Democratic, mostly urban, and largely progressive on fiscal issues), on the local level such black-Mexican coalitions have proven much harder to create or sustain. It is by no means certain, therefore, that the explosive growth of the Mexican American population will lead to political empowerment of other minority groups, such as blacks.

In presidential politics, the concentration of Mexican Americans in three important states (California, Texas, and Illinois) could potentially give Mexican American voters an important amount of leverage, but this leverage would depend on the state in question being very closely contested, and on Mexican American voters turning out at a high rate and voting as a block. While Mexican American voters have generally favored Democratic candidates over Republican in presidential elections in proportions almost high enough to qualify as 'block voting,' the low turnout of Mexican Americans, and the lower fund raising potential of the Mexican American community compared to other groups means that national candidates are likely to continue (at least in the short term) to view the Mexican American electorate as a marginal, rather than a central player. DeSipio and Rocha (1992) argued that Dukakis' successful courting of Mexican American

voters and organizations during the 1988 Democratic primaries was a key ingredient in his successful run for the nomination, especially in the Southwest. They also note, however, that once the primaries were over Latino political interests were quickly marginalized.

Finally, the political status of Mexican immigrants both in the U.S. and back home in Mexico has undergone rapid changes in the 1990s with eventual outcomes that are far from certain. There is substantial evidence that the long-standing trend of low naturalization rates for Mexican immigrants is being reversed. Naturalization applications received by the INS had been steadily below 300,000 for many years but rose to more than 500,000 in fiscal year 1995, 1.3 million in fiscal year 1996, and are expected to be even higher in 1997 (Migration News, 4 /97). Three factors seem to be motivating this unprecedented increase. First, the Democratic party in the U.S. applied pressure to speed up the naturalization process prior to the elections of 1996, because immigrants (especially Hispanic immigrants) were viewed as potential supporters of the Democratic party. The deluge of naturalization applications, and the reported pressure by the Clinton administration on the INS to speed the process up led to some embarrassing errors, including the failure to properly screen some applicants for prior criminal records (Migration News, 4 /97). The second factor has been changes in Mexican law which allow Mexicans who naturalize as U.S. citizens to retain their Mexican citizenship (which includes the right to own certain kinds of land in Mexico), and the law will also allow Mexican citizens in the U.S. to vote in Mexican elections as early as the year 2,000 (Migration News, 6 /97). These changes in Mexican law have removed important barriers that previously kept many Mexican immigrants from naturalizing. The third set of factors include the 1996 welfare reform and the general political climate which has targeted immigrants (even legal immigrants) and limited the social services and benefits for which they are eligible. In an anti-immigrant political environment, U.S. citizenship carries more benefits. If the new trend toward naturalization continues, the political power of Mexican Americans will undoubtedly grow because the number of potential voters will grow, and Mexican Americans will move closer towards fulfillment of their potential in electoral politics.

Notes

*The author would like to thank Marta Tienda for helpful comments and Fay Booker for research assistance. This research has been supported by the U.S.-Mexico Binational Commission on Immigration.

1. Bean and Tienda (1987) discuss the fact that the official U.S. census list of Hispanic surnames changed from one census to the next, so that census counts of Hispanics are not strictly comparable.

2. By far the largest survey of Hispanic political representation is NALEO (1994), whose data includes officials down to the school board level, but their data only goes back to 1984 and is therefore of only limited use in studying the long term trends.

3. The Hispanic share of the adult citizen population is much more stable than the Hispanic share of total population, because the latter reflects highly variable and difficult to measure levels of legal and especially illegal immigration. The 1960 census did not ask about citizenship, so citizenship rates for 1960-1970 have been determined by linear extrapolation from the rest of the data set. Hispanic share of adult citizen population in 1993-1995 is set to be equal to the Hispanic adult citizen share in 1992.

4. Among the other in my sample that I do not present here, Illinois has the smallest Hispanic population (just over 4% of total adult citizens in 1992) of the states in our sample and does not cross the 0.5 parity level until 1993. New York, with its heavily Puerto Rican Hispanic population (Hispanics make up about 6.5% of the adult citizen population of New York in 1992), also does not cross the 0.5 parity level until 1993. Both New York and Illinois show signs of a breakthrough into significant electoral representation, but the signs are too recent to allow for any conclusions at this time. Florida, with its mainly Cuban Hispanic population crosses the 0.5 parity level in the late 1980s. There is enough of a pattern in the data to conclude that the Cuban American population, which is located mainly in Florida, has made a transition into the realm of electoral politics. Given this evidence, I can identify a Cuban American electoral generation, beginning in the early to mid 1980s.

5. New Mexican exceptionalism has frequently been commented upon in the literature (Sierra, 1992; Pachon 1991; Padilla and Ramírez, 1974). The New Mexican population consists of Hispanics of Mexican extraction and also of the descendants of the Spanish conquistadors, called Hispanos (see Bean and Tienda, 1987). The citizenship rate of the Spanish surnamed population of New Mexico has fluctuated between 85% and 95% between 1970 and 1992. By comparison, less than 50% of California's Hispanic population are citizens (based on the CPS figures for 1988-1992). Among the other states, only Colorado has citizenship rates equal to those of New Mexico, and these high citizenship rates are also partly due to a centuries old population of Hispanos.

6. Because the data in this study consist of elected officials, the contours of Figure 1 do not describe the years of grassroots political mobilization that may precede the eventual electoral breakthrough.

7. It is assumed that the first electoral gains are probably made at the level of school boards and local offices, which are not captured in this data set. The achievement of sizable elective representation in state legislatures, state executive positions, and the U.S. congress generally represents a subsequent threshold.

8. CASA competed with the RUP for influence in the 1970s, and absorbed some of the RUPs activists when the RUP faded from the scene in the late 1970s.

9. This is not to suggest, of course, that radicalism has disappeared from the Mexican American political spectrum. The tradition of radicalism is far too rich to have disappeared, but it has certainly ceded its central position to the assimilationism of electoral politics.

IMPACTS OF MIGRATION

Transferability of Skills and the Economic Rewards to U.S. Employment for Return Migrants in Mexico

*Steven S. Zahniser & Michael J. Greenwood**

Introduction

Migration from Mexico to the United States is substantial. Mexico is the single most important source of legal immigration to the United States and the primary source of unauthorized migrants. Between 1989 and 1995, the United States admitted more than 2.5 million persons of Mexican birth as legal resident aliens. Over two million of these immigrants utilized provisions of the Immigration Reform and Control Act of 1986 (IRCA), which gave certain unauthorized entrants to the United States the opportunity to become legal residents. In 1995, the United States admitted as legal resident aliens 89,932 persons born in Mexico, of whom 2,972 were IRCA legalizations.[1] Moreover, between 1989 and 1994, the U.S. Border Patrol located 6.4 million persons from Mexico who were deemed deportable.[2]

Employment and earnings opportunities in the United States relative to Mexico are clearly a primary factor driving the flow of migrants. Massey et al., (1987) document how the costs of later Mexico-U.S. migration are reduced by earlier flows. These cost reductions perpetuate and even increase the flows over time (Massey, 1988). Although large numbers of additional migrants remain more or less permanently in the United States each year, the flow long has been characterized by return migration to Mexico (Massey et al., 1987; Mines, 1984; Ranney and Kossoudji, 1983; and Bustamante, 1977).[3]

Migration is an investment in human capital. As such, migrants themselves may anticipate a differentially higher return to their labor services in the United States than in Mexico. During their residence in the United States, migrants presumably learn new skills and may obtain additional education. For example, an agricultural laborer in Mexico may become an agricultural laborer in the United States, where new and different agricultural skills are acquired. In time, the individual may move to an urban area and work in endeavors that have little direct connection to agriculture, such as in restaurants or factories. If such persons subsequently return to Mexico, they bring with them knowledge and skills not acquired in Mexico. If this newly acquired human capital earns a reward in Mexico, then returning migrants will enjoy higher earnings than otherwise comparable individuals who never have migrated to the United States. Moreover, the anticipation of higher future returns in Mexico resulting from a period of U.S. employment may enter into the decisions of Mexicans regarding whether to migrate to the United States.

For various Mexican communities of origin, a number of case studies have attempted to assess the economic consequences of remittances sent home by migrants in the United States or U.S. savings brought back by returning migrants.[4] For the most part, these studies do not acknowledge that new and different skills are accumulated when the migrant works in the United States, that these skills are more or less transferable back to Mexico, and that U.S.-acquired skills may have a payoff in Mexico. The probable reason for this prior lack of attention to this potentially important channel of influence on source communities is that until fairly recently comprehensive data relating to the income or earnings of Mexican migrants and nonmigrants have been unavailable.

In this paper, we utilize a unique data set collected by the Mexican Migration Project to explore the relationship between U.S. migration experience and the Mexican earnings of return migrants. We present evidence that return migrants reap substantial returns to their U.S. work experience in the Mexican labor market. Moreover, we advance a theoretical argument to explain why this finding is not altogether unexpected. Specifically, if a migrant's reservation wage in the United States is an increasing function of his or her U.S. experience, then the expected

wage in Mexico necessary to induce returning to Mexico is also an increasing function of that experience.

The paper is organized as follows. The following section, "Data," describes the data used in the paper and identifies their source. The section titled "Theoretical Model and Econometrics" lays out the theoretical model that guides our thinking regarding the reservation wage argument and describes the econometric techniques that we employ. The section titled "Empirical Results" discusses our empirical results, and the final section provides a summary and conclusions.

Data

The data for this paper are drawn from the Mexican Migration Project, an ongoing study of the migration experiences of households throughout western and central Mexico. The project, which is headed by Jorge Durand and Douglas Massey, has its roots in a 1982 study of four communities in the states of Jalisco and Michoacán (Massey et al., 1987) which have been the origin of much migration to the United States. Since 1987, the project has visited one or more new communities on an almost annual basis. Although the communities are not chosen at random, an effort is made to examine communities of varied sizes and economic bases in each state of the region. At this time, data are available for 43 communities in eight Mexican states. Table 1 provides an overview of these communities and their prominent features.

Typically the project interviews 200 household heads selected at random in each community. However, some household heads were in the United States at the time that interviews were conducted in their hometowns in Mexico. For this reason, the project traces and interviews about 20 such individuals from each Mexican community in the United States. Thus the overall sample contains persons who have never migrated to the United States, migrants who have returned to Mexico, and migrants who had not returned to Mexico by the time that the Mexican Migration Project visited their respective communities of origin.

Respondents are asked a variety of questions concerning their current demographic characteristics, the monthly income of the household head, and their families' migration experiences. The head of household is also asked to reconstruct his or her employment and migration history, which is used to calculate total U.S. migration experience. The interviews utilized in this paper occurred between 1982 and 1996, and all monthly income figures are converted to 1994 new pesos.

For the purposes of our analysis, we have excluded observations on household heads over 65 years of age. The resulting data set contains 5,273 observations, 4,884 drawn from the 43 communities in Mexico and 389 conducted in the United

(1) Population figure for this community reflects the population of the entire municipality (similar to a county in the United States) and not just the population of the town. Population figures are rounded to nearest non-zero thousand.

A *tenencia* is a community that is not the seat of government of the municipality to which it belongs.

Sources: Mexican Migration Project, Table 1: Sample Information, web page (http://lexis.pop.upenn.edu/mexmig/sampletable.html), 1997; and INEGI (1993).

States. Of the 4,884 heads of household who were interviewed in Mexico, 4,367 were employed at the time of the interview. These 4,367 individuals are the focus of our investigation, but the information provided by those interviewed in the United States and those not working in Mexico is also used in the analysis.

Sample statistics are reported in Table 2. Of the 4,367 Mexican household heads in the sample who were employed at the time of the interview, 1,341 (30.7 percent) reported U.S. migration experience. This experience ranges from one month to over 45 years, but 72.4 percent of those with migration experience resided in the United States for five years or less. Migration experience also varies considerably by community, since certain communities have had considerable involvement for many years in what is widely seen as a cumulative phenomenon, whereas others have had little or no experience (Massey, 1994). The models described below therefore contain 42 community dummy variables that control for community differences as well as unobserved community characteristics that could influence income or earnings.

Theoretical Model and Econometrics

Individual *i*'s decision to return to Mexico from the United States involves a comparison of expected utility in the two countries. Let i's expected utility in the United States be

$$(1) \quad u_i = u_i[w_{ius}(usexp_i), oy_{ius}, e_i],$$

and that in Mexico be

$$(2) \quad u_i^* = u_i^*[w_{imx}, oy_{imx} - c_i, e_i],$$

where $w_{ius}(usexp_i)$ is the wage rate in the United States, which is an increasing function of U.S. experience; w_{imx} is the expected wage rate in Mexico; oy_{ius} (oy_{imx}) is income from sources other than labor in the United States (Mexico); c_i is the fixed cost of moving from the United States to Mexico; and e_i measures unobservable taste factors. The individual returns to Mexico if and only if

$$(3) \quad u_i^* > u_i.$$

The probability of returning to Mexico is given by

$$(4) \quad P[i \text{ returns}] = P[u_i^*(w_{imx}, oy_{imx} - c_i, e_i) > u_i(w_{ius}\{usexp_i\}, oy_{ius}, e_i)].$$

If explicit functions are specified for u_i and u_i^* and if these are solved for e_i, the probability of returning to Mexico is given by

(5) $P[i \text{ returns}]=P[e_i > z(w_{imx}, w_{ius}\{usexp_i\}, oy_{ius}, oy_{imx}, c_i)]$.

Now

(6a) $M_i = 1$ iff $e_i > z(.)$, and

(6b) $M_i = 0$ otherwise,

where $M_i = 1$ indicates that individual *i* returned to Mexico and $M_i = 0$ indicates that the individual did not return.
The reservation wage $w_{imx=imx0}$ is the value of w_{imx} for which

(7) $u_i^*[w_{imx}, oy_{imx} - c_i, e_i] = u_i[w_{ius}(usexp_i), oy_{ius}, e_i]$.

Thus the reservation wage is an increasing function of U.S. experience:

(8) $w_{imx=imx0} = f[w_{ius}(usexp_i), oy_{ius}, oy_{imx}, c_i)]$.

Consequently, the more U.S. experience an individual has, the higher the expected wage in the United States, and thus the greater the expected wage in Mexico that is required to induce his or her return. More nonlabor income in the United States, such as from transfer payments, and higher costs of migrating back to Mexico also increase the reservation wage.

The econometric model estimated here is a standard human-capital, log-earnings function that includes variables for education, Mexican experience and its square, and U.S. experience and its square. Education is measured as the number of years of schooling completed. A dummy variable also is included for those who have education beyond the *preparatoria* (12 years of education), which corresponds to a high school education in the United States. In the types of communities included in the sample, individuals with any higher education are fairly rare and may thus earn a differential return due to their possible status as community leaders or, in general, community resources.

The variable for Mexican labor market experience is defined as age less six less years of schooling (less U.S. experience when relevant). U.S. experience is the number of years spent in the United States, which is defined as total months of U.S. experience divided by 12. Unfortunately, the survey instrument does not indicate the number of months that the individual actually worked in the United States,

so we assume that all months spent in the United States entailed work, which clearly overstates actual U.S. labor market experience. Moreover, the number of U.S. migration spells and their pattern of duration could influence the nature of human capital accumulation, but we employ a measure of cumulative months. Finally, if the primary occupation in the United States matches the primary occupation of subsequent employment in Mexico, a higher probability exists that occupation-specific human capital was transferred back to Mexico. The regressions contain a dummy variable that equals one if such a match exists and otherwise equals zero.

U.S. experience may have differential returns to various occupations in Mexico, depending in part on the relevance of the experience to Mexican employment opportunities, which in turn is likely to reflect the general versus specific form of human capital accumulated in the United States. The model therefore contains a vector of dummy variables that indicate the head of household's occupation. To identify specific Mexican occupations that reflect returns to U.S. experience, we interact these dummy variables with predicted U.S. experience.[5] The model also contains demographic characteristics of the household head, including gender (equals one if female and zero if male) and marital status (equals one if married and zero otherwise). Moreover, it contains several household characteristics: a dummy variable that equals one if the household head's spouse works outside the home and otherwise equals zero; the total number of workers in the household; and the total number of nonworkers in the household.

A period of work in the United States may allow an individual to send remittances back to Mexico, or the migrant may return to Mexico with "pocket" savings. Such funds may be used in Mexico to invest in a business or agricultural land, in which instances reported income may include a return to the individual's business endeavors or land holdings. Thus for some observations the measure of reported income may include more than a return to human capital per *se*, since the Mexican Migration Project collects information only on income and not specifically on earnings. As a partial correction, the model includes a set of dummy variables for business ownership, which indicate the specific type of business owned by the household head.[6] It also contains a measure of the amount of agricultural land owned. A cleaner way to examine the relationship between U.S. experience and the return to human capital in Mexico is to estimate the earnings regression only for those household heads with no business or land holdings. These results are reported below. Finally, as noted above, the model contains a set of occupational control variables.

The third control vector is a set of 42 community dummies that identify the various communities in which the Mexican interviews took place. The population size of the survey communities varies greatly, from less than a thousand to almost 2.9 million (based on 1990 census data). Observations from larger communities

may have greater variance and consequently cause heteroskedastic errors. A chi-squared test [$c^2(42) = 864.09$, $p < 0.0001$, in the most basic earnings model] easily rejects the null hypothesis of a homoskedastic error structure. Thus each earnings model contains a set of community dummy variables (whose results are not listed), as well as a correction for community-wise heteroskedasticity.

Mexican income is not observed for those household heads who were in the United States at the time of the interview, nor for those who were in Mexico at the time of the interview but were not working. Table 3 reports the results from two probit models, one for the probability of being interviewed in Mexico and one for the probability of working. Inverse Mills ratios are derived from these probits. The various equations of the model are identified. Unlike the income regressions reported below, neither probit contains the detailed business or occupation controls, but all regressions include community controls. Moreover, the probits contain two dummy variables that closely relate to the propensity of migrating to the United States. The first indicates the presence of any family member in the United States, and the second equals one if the individual is a legal U.S. resident and otherwise equals zero. Moreover, age and its square are included in the probit for the probability of being interviewed in the United States in place of Mexican experience, U.S. experience, and their squares.

Higher expected wages in the United States are clearly a major force in the flow of migration from Mexico. Moreover, expected wages in Mexico not only enter into decisions to migrate from Mexico to the United States, but they also influence return migration. Indeed, a major hypothesis of this paper is that experience gained in the United States influences the earnings of return migrants to Mexico. In this way, time spent working in the United States may influence the expected wage differential and thus affect the decision to return. Consequently, expected Mexican wages influence time spent working in the United States. For this reason, we treat the U.S. experience variable (and its square) as endogenous. Table 4 displays the results of a first-stage tobit regression from which the predicted values of U.S. experience are derived. All predicted values of U.S. experience less than zero are set to zero in the second-stage earnings regression.

Empirical Results

U.S. experience has a significant payoff in the Mexican labor market. An additional year of U.S. experience yields about an 8.9-percent return in Mexico in terms of monthly income (Table 5). Estimated at the mean income of those who never migrated, this amounts to 109 new pesos per month at 1994 prices, or about 28 U.S. dollars.[7] Given the argument presented above that the reservation wage is an increasing function of U.S. experience, we are not entirely surprised at this

large return. In contrast, an additional year of Mexican experience yields a return of about 1.1 percent, and the square term for Mexican experience has the typical negative sign and is also significant. Thus an additional year of U.S. experience yields a monthly return that is at least eight times higher than that of an additional year of Mexican experience.

An additional year of Mexican education below the *preparatoria* level yields a monthly return in Mexico of 3.6 percent, or less than half the return to an additional year of U.S. experience. However, an additional year of education beyond the p*reparatoria* yields a return of about twice that of U.S. experience. For those who do not plan to continue their education beyond the *preparatoria*, the former results suggest a strong incentive to migrate to the United States at the earliest possible age, return to Mexico with U.S. experience, and enjoy the higher returns in Mexico that are discounted less. This observation also may indicate one reason for the young ages at which many Mexican migrants make their first trip to the United States.[8]

n.a. = not applicable.

(a) No industrial owner or supervisor was estimated to possess U.S. migration experience, thus the interaction term for this occupational class was omitted from the model containing occupational interaction terms.

(b) To ensure convergence of the model for business owners only, these three variables were omitted.

Results for dummy variables denoting community of origin are not reported.

*** indicates |t| >= 1.96; ** indicates 1.67 <= |t| < 1.96; * indicates 1.29 <= |t| < 1.67.

The regressions for "all individuals" contains business and land owners as well as "workers." The control variables for certain types of businesses (cattle trader, manufactured goods trader, tortilla mill, repair shop or garage, and small assembly shop) are statistically significant, as is the control for the amount of agricultural land owned. Because the dependent variable entails a measure of income and not just earnings, it may reflect returns to factors of production other than labor. Remittances sent from the United States to Mexico and savings accumulated in the United States and brought back to Mexico could be invested in a business or a farm and thereby yield a return to capital and land. Thus the regression for "workers" may yield a more accurate assessment of the returns to human capital investments. This regression suggests an annual return to an additional year of U.S. experience of 10.0 percent, about nine times the return to the first year of Mexican experience.[9]

Business owners with U.S. migration experience earn more than their counterparts who lack such experience, as is evidenced by the model for business owners only. This model indicates that each year of U.S. experience increases the

income of business owners by 5.4 percent, but the coefficient is only marginally significant. Interestingly, additional experience in Mexico does not appear to raise the income of business owners, as the coefficients for this variable and its square are not statistically significant.[10]

The occupational match variable identifies return migrants who have the same occupation in Mexico as they had in the United States. These individuals enjoy a particularly high return of 17.7 percent. The life histories of these persons reveal that practically all of them also had experience in their present occupation *prior* to their first U.S. migration experience. These individuals therefore possess the distinct advantage of accumulating skills and knowledge in the same occupation over an extended period of time, uninterrupted by their spells as migrants. This characteristic may explain the strikingly high returns to the occupational-match variable.

When the U.S. experience variable is interacted in the regressions for all individuals with the various occupational dummies, the resulting coefficients are not statistically significant, except for the salesperson interaction term. A similar regression for "workers" only, whose results are not reported, does not generate any significant parameter estimates for these terms.

We also implement two alternative econometric specifications, although we do not report their results for want of substantially different results from our basic model. The first of these replaces the Mills ratio pertaining to interview location with a "spliced" Mills ratio vector. Specifically, we estimate two separate probit models to generate an alternative Mills ratio for the interview location in order to distinguish return migrants from non-migrants. One probit model contains the return migrants and the U.S. respondents, and the other contains the non-migrants and the U.S. respondents. We then "splice" together the two vectors of Mills ratios generated by these models to form a single vector and substitute this new vector into the first-stage tobit and second-stage earnings regressions. The motive for this innovation is our concern that the nested, two-tiered selection process experienced by return migrants may influence the results of the income regression, as return migrants first decide to migrate to the United States and then later elect to return to Mexico. However, the substitution of the "spliced" vector causes no noteworthy changes in the results of the earnings regression.

The second alternative incorporates several additional variables related to U.S. immigration status. Mexicans who are legal U.S. residents may possess certain advantages and disadvantages relative to Mexicans without documents. For example, U.S. employers may be more certain of the continuing presence of workers with documents and therefore may be more likely to give them jobs that entail added responsibility. In general, the U.S. employers of workers who are legally entitled to work in the United States have more incentive to train and otherwise invest in these workers than in workers whose continued employment is uncertain.

Similarly, Mexican employers may be less likely to employ and less likely to train workers with legal U.S. residency out of concern that these persons may soon depart for the United States. For these reasons, we estimate an earnings equation that includes a dummy variable equal to one if the individual is predicted to possess legal residency in the United States and zero otherwise. Interaction terms between this variable and U.S. experience and its square are also included. Because the probability of obtaining legal residence in the United States increases with U.S. experience, we treat the documents variable as endogenous and estimate a first-stage probit for this variable. Predicted values of the variable less than or equal to 0.5 are set equal to zero in the corresponding earnings regression, and values greater than 0.5 are set equal to one. However, none of these variables generate statistically significant parameters in the earnings regression.

Summary and Conclusions

Migration from Mexico to the United States may affect the Mexican economy in numerous ways through several potential channels of influence. As a substitute for trade in goods, the flow of labor may reduce exports from Mexico to the United States. Migrant remittances that flow from the United States back to Mexico may affect both consumption patterns and capital accumulation in Mexico. By reducing excess labor supply in Mexico, migration may lessen not only employment and underemployment, but also social tension.

Due to the volume of migration from Mexico to the United States and the circularity of the flow, human capital acquired during a period of employment in the United States and returned to Mexico may be one of the strongest channels through which migration affects the Mexican economy. However, data limitations on the Mexican side of the border have prevented a detailed analysis of this channel of influence. In this study we employ a unique set of survey data to study the impact of migration on the wages of returning migrants relative to a control group of individuals who have never participated in migration to the United States.

Presumably, those Mexicans who migrate to the United States expect to earn a higher return on their labor services in the United States than in Mexico, given their costs of migrating. If they had not participated in U.S. migration, these same individuals also may have earned higher returns in Mexico than their non-migrating counterparts. To control for the possibility that the resulting parameter estimates are tainted by selectivity bias, we perform a Heckman selectivity correction by estimating a probit model for the probability of participating in U.S. migration. This regression is distinguished from the earnings equation by the inclusion of a set of variables relating to possible migration networks that facilitate movement to the United States. The equation yields an inverse Mills ratio that is employed in the

earnings equation. The model also contains a second selectivity correction for participation in the Mexican labor market.

The higher an individual's expected earnings in Mexico, the less time he or she will wish to devote to work in the United States, *ceteris paribus*. Thus potential Mexican earnings and time spent working in the United States are endogenous. To account for this endogeneity, we estimate a first-stage tobit model for total U.S. migration experience. Finally, because observations are drawn at different times from communities of varying size and economic circumstances, we include a set of community dummy variables and provide a correction of community-wise heteroskedasticity.

Empirical results indicate a high return to U.S. experience that is at least eight times as great as the return to Mexican experience. Moreover, for those persons who transfer accumulated occupational skills from the United States to Mexico in the sense of having the same broad occupation in each country, monthly income increases an additional 17 percent. These results suggest that Mexican migration to the United States, in addition to being encouraged by the expectation of higher wages in the United States, may be spurred by the expectation of higher wages in Mexico for those who return. The returns to U.S. experience are about twice as high as the returns to less than 12 years of Mexican education, which gives persons who do not plan to continue their education beyond the *preparatoria* a powerful incentive to migrate at the youngest possible age.

Notes

* This research was supported by the U.S. Commission on Immigration Reform's Mexico-U.S. Binational Migration Study. Zahniser is a postdoctoral fellow in the Social Science Research Council's International Migration Program. He acknowledges the additional support of a program grant funded by the Andrew W. Mellon Foundation. We are indebted to Donald Waldman for numerous discussions concerning our econometric approach and to J. Edward Taylor and Marta Tienda for many helpful suggestions. Jorge Durand and Douglas Massey provided the data from the Mexican Migration Project without which we could not have conducted the research reported here. We are grateful to them and their research assistants Kristin and Victor Espinosa, who provided capable technical support.

1. U.S. Department of Justice, various issues. Immigration statistics are for fiscal years, not calendar years.

2. U.S. Department of Justice (1996), Table 74.

3. Census data place the Mexican-born population in the United States at 759,711 in 1970, 2,199,221 in 1980, and 4,298,014 in 1990 (U.S. Bureau of the Census, 1973, 1984, 1994).

4. Durand and Massey (1992) survey many of these case studies.

5. The occupational dummy variables are listed in Table 5. The excluded comparison group is professionals and administrators.

6. The business dummy variables are listed in Table 5. The excluded comparison group is household heads who do not own a business.

7. The figure in U.S. dollars was calculated using the period-average exchange rate for 1994 in International Monetary Fund (1997).

8. When one considers all members of the households surveyed by the Mexican Migration Project (including the grown offspring of the household heads) who were born between 1961 and 1970, half of those with U.S. experience made their first trip to the United States by the age of 19.

9. As Table 1 indicates, five communities in the sample were surveyed in 1982, and the other 38 between 1987 and 1996. When these first five communities are removed from the sample and the series of models is re-estimated, the results change very little, although the estimated return to U.S. experience is somewhat larger. The coefficient for predicted U.S. experience (0.0963) remains highly significant, as do the coefficients for Mexican experience and its square (0.0121 and -0.0002). In contrast, when two outlying observations with monthly income in excess of 35,000 new pesos are dropped from the sample, the estimated return to U.S. experience is slightly smaller. The coefficients from this re-estimation of the model are also statistically significant: 0.0875 for the fitted value of U.S. experience and 0.0115 and -0.0002 for Mexican experience and its square.

10. A separate model for landowners only failed to converge, presumably due to the small number of observations. An ordinary least-squares regression for this group produced statistically insignificant parameter estimates for U.S. experience and its square.

Impacts of Migration

Impactos de los cambios económicos en el agro mexicano y en la migración: un análisis micro-multisectorial

Antonio Yúnez Naude[1]

Introducción

El propósito del reporte es estudiar los posibles efectos en la economía rural y en la emigración del campo a las ciudades y a los E.U.A. de algunas de las modificaciones en el contexto macroeconómico de México. Los resultados presentados han sido obtenidos de un proyecto de investigación, cuya base de datos se elaboró a partir de trabajo de campo efectuado entre 1993 y 1996 y de modelos cuantitativos micro- multisecotriales.[2]

Nuestro enfoque trata de superar las limitaciones de los estudios nacionales de impactos mediante una metodología distinta, cuyo sujeto de análisis son las poblaciones rurales y sus hogares. Hace uso de los modelos multisectoriales, pero, en vez de ser aplicados a una economía en conjunto y a su agro, tiene un carácter local y específico. Esto es así porque los estudios macroeconómicos no logran

capturar aspectos fundamentales de sectores rurales caracterizados por la presencia de unidades familiares de producción y consumo. (Taylor y Yúnez-Naude: 1995).

La ausencia de información oficial y las exigencias de datos para capturar las especificidades y heterogeneidad de la economía agropecuaria de países como México hacen necesaria la elaboración de bases de datos construidas a partir de información primaria y directa en base a trabajo de campo. Esto lo hemos hecho a partir de encuestas socioeconómicas detalladas a una muestra representativa de hogares de las poblaciones que hemos estudiado. Las encuestas capturan tanto los flujos monetarios en las economías de los pueblos, como los no monetarios (por ejemplo, el uso de trabajo familiar, no remunerado, en las actividades productivas). La información obtenida en el trabajo de campo se usa para elaborar una matriz de contabilidad social (MCS en adelante) de cada población, que es la base de datos con la que se alimenta el modelo multisectorial para cada una de ellas.

En este documento se presentan los resultados obtenidos al poner en práctica nuestra propuesta a cuatro poblaciones del México rural: Concordia, localizada en el estado de Coahuila, El Chante en el de Jalisco, Napízaro en Michoacán y San Quintín en Baja California. Los pueblos no sólo tienen características socioeconómicas distintas. Además, su diversidad se dá en cuanto a la emigración nacional e internacional de sus habitantes: Napízaro es una comunidad típica de emigrantes a los E.U.A.; aunque El Chante también cuenta con una gran cantidad de personas que trabajan en el país vecino, las remesas que el pueblo recibe son de menor peso para su economia respecto a Napízaro; en contraste, tal tipo de emigración es marginal en Concordia y prácticamente nula en San Quintín (de hecho, el pueblo bajacaliforniano demanda trabajo de emigrantes del resto de México).[3]

Incorporar al estudio del agro y de sus procesos de emigración tal diversidad es de suma relevancia (abajo veremos que el papel que en cada pueblo juega la migración, trae consigo consecuencias importantes en cuanto a los impactos que sobre cada uno de ellos tienen cambios en el contexto macroeconómico de México y en la política agrícola). Además contrasta con los estudios existentes al respecto, que se enfocan casi exclusivamente al análisis de comunidades de alta migración a los E.U.A..

A partir de modelos de multiplicadores calculamos los impactos que sobre los ingresos de cada uno de los cuatro poblados tendrían cambios recientes en el contexto económico del país (reducción del salario real y devaluación del peso), así como en materia de política agrícola (PROCAMPO y dos esquemas alternativos a este programa) y la aplicación del Federalismo a una de las poblaciones estudiadas.

En la sección que sigue se hace una breve descripción de la estructura socieconómica de las cuatro poblaciones. En la tercera se discuten las simulaciones realizadas y en la cuarta los resultados. El texto concluye con una serie de reflexiones

sobre las implicaciones de los hallazgos en cuanto a los fenómenos migratorios y en materia de política económica.

Las características de los pueblos

Concordia es una población ejidal del municipio de San Pedro de las Colonias, localizado en la comarca de La Laguna. El clima predominante de la región —con temperaturas extremas y bajo índice de lluvias— impide el desarrollo de una agricultura de temporal y hace indispensable el sistema de riego.

Hasta los inicios de la década de los noventa el algodón representó el principal producto agropecuario de La Laguna. Esto cambió radicalmente a partir de 1992, ya que la fibra dejó de ser una alternativa rentable para los agricultores. Frente a ello se inició un proceso de sutitución que culminó con la producción casi exclusiva de maíz y frijol. En la actualidad, la producción de básicos en La Laguna (incluyendo a Concordia) es comercial, con elevados rendimientos (de 3.1 ton. por Ha.) y uso de paquetes tecnológicos sofisticados.

El cambio en el contexto agrícola regional también ha llevado a modificaciones en el mercado laboral. En efecto, frente a la reducción de la demanda de trabajo por parte del complejo algodonero y al carácter estacional y breve del ciclo agrícola para el cultivo del maíz y frijol, los habitantes de Concordia se han visto forzados a buscar empleo, agrícola y no agrícola, en las ciudades de la región e incluso en otras zonas del país y en los E.U.A.

El Chante es una población agrícola del Valle de Autlán. Es productora de caña de azúcar y, en menor medida de maíz y ganado. La estructura de la propiedad de su tierra es mixta, con ejidos y propiedad privada. Los ejidatarios se dedican principalmente a la producción de maíz en tierras de buen temporal para el consumo propio o la venta y los productores privados al cultivo de la caña irrigada. La caña es vendida a un ingenio localizado en el Valle, que también es el que provee a los cañeros de insumos y otros recursos para la producción.

Aunque muchos de los habitantes de El Chante tienen parientes que han migrado a los E.U.A. (sobre todo en el período “bracero”), la economía local no depende mucho de sus remesas.

Napízaro es una población ejidal a orillas del lago de Pátzcuaro del Municipio de Erongarícuaro que en los últimos quince años ha pasado de ser de agrícola a ganadera. No obstante, el maíz y el frijol siguen siendo importantes dentro de las actividades locales. La orientación de la economía de Napízaro es mixta, ya que su producción la obtiene en base al trabajo familiar y parte la orienta para el consumo propio (y ahorro familiar) y parte para la venta.

La economía de San Quintín (localizada en el Valle con el mismo nombre, que forma parte del extenso Municipio de Ensenada) es de corte capitalista y

comercial: está dominada por las actividades comerciales, por los servicios de hotelería y restaurantes y por el empaque de productos hortícolas para la exportación a los E.U.A. llevado a cabo por una empresa ubicada en la localidad. Esta última actividad tiene elevadas exigencias de trabajo en la época de cosecha del Valle, por lo que recurre a los servicios de emigrantes de los estados de Oaxaca y Guerrero.

Produccción local

En términos del valor de la producción generada (valor agregado, producto interno bruto o PIB), el tamaño de los pueblos estudiados es disímil: Concordia es 1.15 veces más grande que Napízaro, El Chante es más de 6 veces mayor que Concordia y San Quintín 2.7 más grande que El Chante (ver los totales de los cuadros 1a, 1b, 1c y 1d).

Las tres poblaciones más pequeñas se dedican, básicamente, a la actividad agropecuaria. Sin embargo, difieren en su composición (cuadros 1a, 1b y 1c): la más importante de Napízaro es la ganadera (explica el 61% de su PIB), mientras que la agricultura es la de mayor peso en la oferta local de El Chante y Concordia (49% y 66%, respectivamente). No obstante, su composición difiere entre las dos poblaciones agrícolas: el cultivo más importante de El Chante es la caña y el maíz y el frijol en Concordia. En contraste, San Quintín se dedica a la provisión de servicios (cuyo peso en el PIB local es del 65%) y al procesamiento de hortalizas (35%, cuadro 1d).

Conviene añadir que el comercio —cuyas ventas están compuestas, principalmente, de bienes procesados— es una actividad importante en los cuatro pueblos. Debido a la ausencia de producción manufacturera en ellas, los productos comerciados tienen que ser importados, lo cual indica la dependencia de las economías locales con su exterior (es decir con el resto de México).[4]

La contribución del trabajo familiar en el valor agregado es muy importante en Concordia y El Chante (explica, respectivamente, el 43% y el 50% de su PIB, cuadros 1b y 1c), relativamente importante en Napízaro (21%, cuadro 1a) y no importante en San Quintín (14%, cuadro 1d).[5] No obstante el gran peso del trabajo familiar en las actividades económicas de Concordia y El Chante, ambas también hacen uso de trabajo asalariado (su peso en el valor agregado de la primera población es del 28% y del 23% en la segunda). Esto es así en Concordia por las exigencias de mano de obra en las épocas agrícolas pico y, como veremos, porque muchos de sus habitantes trabajan durante todo el año en otras actividades en la región, pero fuera del pueblo. Por su parte, la producción de caña de El Chante requiere de mano de obra adicional para la cosecha, al grado que utiliza los servicios laborales de emigrantes de Guerrero (los últimos explican casi la mitad

del valor agregado proveniente del trabajo asalariado, cuadro 1c). La situación de Napízaro es muy distinta, pues el trabajo asalariado sólo representa el 3% de su valor agregado (la actividad más importante del poblado, la ganadera, se hace a partir del pastoreo en base al trabajo familiar).

Relaciones con el exterior

Un fenómeno de suma importancia en el agro mexicano es la enorme dependencia que las comunidades que lo forman tienen respecto a su exterior (regional, nacional o internacional). Como veremos a continuación, las poblaciones que hemos estudiado no son la excepción, lo cual significa que serán de peso los impactos que sobre ellos tienen cambios en la situación económica y de la política pública de México, así como en las relaciones del país con el resto del mundo (con los E.U.A. en especial).

Fuentes del ingreso de los hogares

Los pueblos tienen fuertes vínculos con mercados de trabajo más allá de la comunidad: Napízaro con los de E.U.A., Concordia y El Chante con los regionales y San Quintín por la demanda que hace de los servicios laborales de trabajadores provenientes de otros estados de la República mexicana. Esto se refleja en los datos sobre el origen del ingreso de los hogares (cuadros 2).

No obstante lo anterior, el peso y las características de tal dependencia varían de poblado a poblado. En efecto, la proporción de los ingresos provenientes del exterior en el total del ingreso de los hogares es mucho mayor en Concordia que en El Chante y Napízaro: 74%, 23% y 23%, respectivamente (cuadros 2a, 2b y 2c).[6] Otra diferencia importante es que la mayor parte del ingreso externo que fluye a los hogares de Concordia proviene de los servicios laborales proporcionados por sus habitantes en la Comarca Lagunera y ciudades aledañas, mientras que para Napízaro éste se compone, principalmente, de las remesas enviadas por los miembros de sus hogares ubicados en los E.U.A. Por su parte, la mitad de los ingresos del exterior recibidos por los hogares de El Chante tienen su origen en el resto de México (la gran mayoría en la región, es decir, en el resto del Valle de Autlán) y la otra mitad proviene de los emigrantes a E.U.A. Como la situación de San Quintín es muy distinta a la de los otros tres pueblos (la empacadora requiere de servicios laborales extraregionales), la vinculación del poblado con el mercado laboral mexicano se refleja en el peso de los ingresos de los hogares de inmigrantes en el total de los ingresos locales de los hogares de San Quintín, que es del 12% (cuadro 2d, séptima fila, segunda columna).

Origen de los insumos

Sin excepción, las actividades de los cuatro poblados dependen marcadamente de los insumos externos: su peso en el total de insumos productivos es del 79% para Napízaro, del 77% para Concordia,[7] del 87% para El Chante y del 98% para San Quintín (cuadros 3). Sin embargo, hay variaciones respecto a su origen: todos los insumos "importados" por Napízaro y Concordia provienen del resto de México, mientras que el 96% de las compras de insumos al exterior de El Chante tienen el mismo origen y el peso de ellas para San Quintín es del 51% (el 4% y 49% restantes, respectivamente, provienen de los E.U.A.).

Las simulaciones

La gran dependencia de las poblaciones del México rural con el exterior es incorporada sistemáticamente en los modelos multisectoriales de multiplicadores. El enfoque es, pues, valioso porque permite cuantificar los posibles impactos en las comunidades de cambios en el contexto económico y en la política pública (es, decir, en las variables exógenas a los pueblos).[8] Al respecto, se han diseñado tres grupos de simulaciones para estimar los efectos que sobre las comunidades estudiadas (y en el agro mexicano en general) tendrían modificaciones en la economía del país. El primero se refiere a la situación macroeconómica de México y consiste en dos experimentos: la reducción del salario real y la devaluación del peso (en general, provocadas por las reformas económicas y por la crisis de finales de 1994). El segundo grupo está relacionado a cambios en materia de política económica y está compuesto por tres ejercicios de simulación: PROCAMPO (uno de los pilares de la política de eliminación de subsidios a la producción de cultivos básicos), el uso alternativo de los recursos de ese programa para la promoción de las actividades productivas y la aplicación del federalismo presupuestal. Por último, se aplicó una simulación a Napízaro, Concordia y El Chante en la que se unen los cambios en el contexto macroeconómico de México (reducción del salario y devaluación) y PROCAMPO.

El conocimiento preciso de la economía de cada uno de los cuatro pueblos y el marcado contraste entre la de Napízaro, Concordia y El Chante frente a la de San Quintín. permite que ello se tome en cuenta en el diseño de las simulaciones. Como la reducción del salario real y PROCAMPO han afectado solamente a las tres primeras comunidades, sólo se le aplicaron tales cambios exógenos a ellas. Es decir, los habitantes de San Quintín no han sufrido tanto de la reducción del salario como los de las otras tres comunidades que trabajan en el resto de México, y el pueblo bajacaliforniano no produce cultivos básicos. Sin embargo, San Quintín aporta más recursos al gobierno de los que recibe de

él y los otros tres pueblos tienen un presupuesto más o menos equilibrado con la federación. Por tal motivo sólo se le aplicó al primer poblado la simulación de la aplicación del federalismo, que equivaldría a PROCAMPO en los tres pueblos restantes. El experimento del federalismo consiste en regresar a los agentes de San Quintín los recursos que aportan al gobierno central, y el de PROCAMPO se basa en la canalización de los pagos por hectárea gubernamentales a los hogares de Napízaro, Concordia y El Chante según la cantidad de tierra que dedican a los cultivos básicos. Se hacen dos ejercicios adicionales para los últimos tres pueblos con el propósito de estimar los impactos de esquemas alternativos a PROCAMPO en las comunidades que reciben estos recursos. Consisten en usar los mismos recursos de PROCAMPO a la promoción de la actividad agrícola o ganadera en vez de usarlos para apoyar directamente el ingreso de los hogares que cultivan básicos.

La forma en que se hizo el experimento de devaluación para Napízaro, Concordia y El Chante también difiere de la aplicada a San Quintín: en los tres primeros pueblos ésta se simula a partir de un aumento en las remesas que los hogares reciben de sus miembros que trabajan en los E.U.A., mientras que para San Quintín consiste en el aumento del valor en pesos de las exportaciones de la principal empresa del pueblo, dedicada a la venta a los E.U.A. de los productos hortícolas que empaca.

Por último, con el fin de evaluar los efectos combinados de la crisis y de la política de apoyo a los productores de cultivos básicos, se hizo una simulación para Napízaro, Concordia y El Chante en la que se unen los cambios exógenos provocados por la reducción del salario real, la devaluación y por la aplicación de PROCAMPO.

En síntesis, los ejercicios de simulación son los siguientes.

1. Cambios en la situación macroeconómica de México

    1.1. Reducción del 20% de los salarios pagados a los miembros de los hogares de Napízaro, Concordia y El Chante que trabajan en el resto de México

    1.2. Aumento en el valor en pesos de las remesas que los hogares de Napízaro, Concordia y El Chante reciben de los miembros que trabajan en los E.U.A. (el aumento equivale al 113% del valor de las remesas, que es la tasa a la que el peso se devaluó entre 1994 y 1996)

    1.3. Aumento del 16% en las exportaciones hortícolas de San Quintín a los E.U.A. (el incremento porcentual es conforme al dato recabado en la encuesta directa y recoje tanto el efecto positivo de la

devaluación del peso en las ventas a los E.U.A. de la empacadora como el negativo por el crecimiento de los costos de los insumos productivos que importa al mismo país)

2. Cambios en materia de política económica

   2.1. PROCAMPO y esquemas alternativos

      a. Pagos directos a los hogares productores de básicos o PROCAMPO (Napízaro, Concordia y El Chante)

      b. Canalización alternativa de los recursos de PROCAMPO: a las actividades agrícolas de Napízaro, Concordia y El Chante y no a sus hogares

      c. Recanalización de los recursos de PROCAMPO a las actividades ganaderas de Napízaro, Concordia y El Chante

   2.2. Aplicación del federalismo a los agentes de San Quintín (el ejercicio consiste en retornar al pueblo los pagos que sus distintos agentes económicos hacen al gobierno federal)

3. Combinación de reducción de los salarios, la devaluación y PROCAMPO en Napízaro, Concordia y El Chante.

Resultados

Los impactos de las modificaciones en el contexto y políticas económicas simulados se encuentran en los cuadros 4, que muestran los efectos relativos de tales cambios en las variables de la base (es decir, de la MCS o del año base) de Napízaro (cuadro 4a), Concordia (cuadro 4b), El Chante (cuadro 4c) y San Quintín (cuadro 4d).

Las primeras líneas de los cuadros 4 (bajo el subtítulo "Ingreso exógeno") muestran los efectos directos de los cambios exógenos en las cuentas de ingresos de cada una de las poblaciones. Por ejemplo: la reducción del 20% del salario real de México significa una disminución directa del 7.99% de los ingresos que los hogares de subsistencia de Napízaro reciben del exterior; la devaluación tiene el efecto contrario pues aumenta directamente los ingresos exógenos de tales hogares en un 66.81%; las transferencias de PROCAMPO los hace crecer en un 36.45% y el efecto combinado de estos tres cambios es el de subir el ingreso exógeno de los hogares mencionados en un 95.26% (cuadro 4a, cuarta fila y segunda, tercera, cuarta y séptima columnas). Las filas restantes (bajo el subtítulo "Ingreso endógeno") reportan los efectos multiplicativos de los cambios exógenos en las cuentas endógenas de cada una de las cuatro poblaciones.

Efectos de los cambios en la situación macroeconómica de México

Las modificaciones sufridas por la economía mexicana afectan a todos los pueblos. Sin embargo, el peso y tipo de relaciones con ella hacen que los impactos de la crisis difieran de comunidad a comunidad.

Reducción del salario real

Concordia es, por mucho, el pueblo más afectado por la caída en el salario real de los trabajadores, pues el impacto directo del fenómeno es la reducción de casi el 20% de los ingresos exógenos totales recibidos por sus hogares. Lo anterior ocasiona que el producto interno bruto (PIB) de la comunidad se reduzca en más del 7% (segunda columna del cuadro 4b). En contraste, el impacto de la crisis salarial no es considerable para Napízaro y El Chante: hace que su PIB disminuya, respectivamente, en sólo un 0.8% y un 1.4% segunda columna de los cuadros 4a y 4c). El efecto es mayor para la economía de El Chante respecto a la de Napízaro por el impacto de la reducción salarial en el ingreso de los trabajadores del pueblo jaliciense que prestan sus servicios en las escuelas públicas de la región.

La reducción de los salarios no afecta en gran medida a los ingresos de las actividades y factores productivos de Napízaro (el que más decrece es el comercio, cuya depresión no sobrepasa el 1.3%). Sus hogares resienten un poco más, aunque la depresión de sus ingresos no sobrepasa el 2.7% (segunda columna del cuadro 4a).

La crisis salarial afecta a todos los componentes de la economía de Concordia, pero algunos la resienten más. Son los casos de las actividades ganadera y comercial (cuya producción cae en 16% y 14%, respectivamente); de las retribuciones al trabajo (familiar y asalariado) y del ingreso de los dos tipos de hogar (segunda columna del cuadro 4b).

La economía de El Chante es menos golpeada que la de Concordia por la reducción de los salarios. La excepción son los maestros de las escuelas públicas, afectados por la dismunición del salario real que les paga el gobierno. Esto hace que el ingreso de los asalariados locales disminuya en más del 10.5% y que el de los hogares no agrícolas lo haga en 3.4% (lo último debido a que la mayoría de los maestros son miembros de los hogares no dedicados a las actividades agrícolas, segunda columna del cuadro 4c).

La crisis salarial también repercute negativamente en los ingresos que el gobierno recibe por las contribuciones de los tres pueblos (primera línea de la segunda columna bajo el encabezado “exógeno total” de los cuadros 4a, 4b y 4c). Lo mismo sucede con la demanda que las comunidades hacen a productos del resto de la región y de México.

Devaluación

Los resultados de la investigación constatan el fenómeno ampliamente documentado en la literatura sobre el desarrollo económico; a saber: que la depreciación de la moneda local tiene efectos positivos en la economía rural. En efecto, la devaluación del peso frente al dólar estadounidense impulsa el PIB de las cuatro comunidades estudiadas (tercera columna de los cuadros 4a a 4c y segunda del cuadro 4d). En el caso de Napízaro, Concordia y El Chante el efecto positivo de la depreciación se dá a través de la migración (ya que aumenta el valor en pesos de las remesas y, en consecuencia, el ingreso de sus hogares), mientras que en el caso de San Quintín tal impacto surge del mayor ingreso en pesos proveniente de la exportación de hortalizas de la empacadora.

No obstante, el enfoque adoptado permite hacer las siguientes precisiones.

Entre mayores ingresos netos del exterior (de los E.U.A.), el impacto positivo para la economía local de la devaluación es mayor. Así entonces, Napízaro es la

población en la que los ingresos del exterior son más importantes y es, precisamente, la que más crece a raíz de la devaluación del peso (en casi un 16%, tercera columna del cuadro 4a); le sigue San Quintín, en la que parte importante de su ingreso proviene de los E.U.A., y cuyo PIB crece en 2.4% (tercera columna del cuadro 4d).[9] Por su parte, la devaluación afecta menos a El Chante (su PIB aumenta en sólo un 1.73%, tercera columna del cuadro 4c) y es aún menos significativa para Concordia (el crecimiento de su PIB no pasa el 1.3%, tercera columna del cuadro 4b).

La depreciación del peso provoca un crecimiento en el ingreso de todos los componentes de la economía de Napízaro, destacándose el de los hogares (sobre todo el de los medianos) y el del comercio (tercera columna del cuadro 4a). Los hogares no agropecuarios y el comercio de Concordia son los que más se benefician con la depreciación del peso (tercera columna del cuadro 4b). También es el ingresos de los hogares no agrícolas de El Chante el que más crece, seguido por el de los hogares mixtos y el de las actividades agrícolas distintas a la producción de caña y maíz, del comercio, de los hogares maizeros y de la ganadería (tercera columna del cuadro 4c). Por su parte, aunque el ingreso de todos los componentes de la economía de San Quintín crece por la devaluación, los más beneficiados son los factores y los hogares y, dentro de ellos, los vinculados directamente con las actividades de la empacadora, es decir: la tierra, el capital, el trabajo de los inmigrantes que laboran en ella y las ganancias de la misma (cuadro 4d, columna dos).

Cabe notar que los pequeños impactos de la depreciación del peso en El Chante y, sobre todo, en Concordia se deben al reducido peso de las remesas en los ingresos totales de sus hogares. Sin embargo, el impacto marginal de un aumento absoluto en las remesas es importante en todas las comunidades. Así por ejemplo, no obstante que el peso de las remesas en el ingreso total de los hogares de El Chante es de sólo el 5.5% (cuadro 2c), por cada dólar de inyección a sus hogares, su ingreso total aumenta en 20%; para Concordia el peso es aún menor (del 2.2%, cuadro 2b), pero el ingreso total de sus familias aumenta en 10% por cada dólar que se le inyecta. Otro aspecto importante a notar respecto a los impactos marginales de la devaluación es que, en términos absolutos, son los ingresos totales de los hogares no agrícolas de El Chante los que más crecen, pero en términos marginales los que más se ven afectados positivamente son los de los hogares cañeros.[10]

Por último, los efectos que la devaluación tiene sobre las tres poblaciones hace que sus contribuciones al gobierno aumenten y que su demanda de productos del reso de México también lo haga. Estos resultados muestran cómo la migración —en concreto, el impacto positivo de la devaluación del peso en las remesas— hace que se abran más las comunidades rurales a su exterior, en este caso al nacional.

Efectos de los cambios en materia de política pública

Las inyecciones gubernamentales de recursos benefician a las economías de los cuatro pueblos, sea mediante PROCAMPO, la utilización de los recursos de éste programa para promover a las actividades productivas agropecuarias o a partir de la aplicación del federalismo fiscal. No obstante y al igual que en el caso de las simulaciones anteriores, el peso, la distribución y la magnitud de los efectos varían de pueblo a pueblo y dependen del tipo de política seguida.

PROCAMPO y políticas alternativas de apoyo a la producción agropecuaria

La comunidad más beneficiada por el esquema de apoyo directo a los productores de básicos es Napízaro: el impacto en su PIB es de aumentarlo en un 6.6% (cuadro 4a, cuarta columna). Por su parte, el PIB de las otras dos que producen cultivos básicos (Concordia y El Chante) crece muy levemente (en 1.24% y 0.24%, respectivamente, cuarta columna de los cuadros 4b y 4c). Esto se debe al peso relativo de las inyecciones de recursos gubernamentales a sus hogares agrícolas: en Napízaro sobrepasa el 35% de los ingresos exógenos de sus hogares, en El Chante es de alrededor del 8% y en Concordia es de sólo el 5% (cuadros 4a, 4c y 4b, respectivamente, cuarta columna, líneas bajo el encabezado "ingresos exógenos").[11] En los tres pueblos, los componentes más beneficiados por PROCAMPO son los hogares productores de cultivos básicos (los tres tipos de hogares en Napízaro, los agropecuarios de Concordia y los maizeros y mixtos de El Chante, cuarta columna de los cuadros 4a, b y c, filas que componen el encabezado "ingresos exógenos").

Conviene detenerse un poco para hacer comparaciones entre los efectos diferenciados de la devaluación y de la aplicación de PROCAMPO. Los resultados discutidos indican que la depreciación del peso tiene mayores impactos positivos que el esquema gubernamental de apoyo al agro en la gran mayoría de los componentes de las economías de Napízaro y El Chante, y que lo contrario sucede con los de Concordia. No obstante, y como ya se mencionó, estas conclusiones dependen del peso de la migración y de la producción de básicos en la economía de los pueblos.

El análisis de multiplicadores permite hacer otro tipo de comparaciones al poderse estimar con él los efectos de aumentos equivalentes en el valor en pesos de las remesas y en las transferencias directas de PROCAMPO. Es decir, estos ejercicios de simulación suponen que la devaluación significa un aumento en las remesas a los hogares con migrantes de, digamos 100 Dls u 800 pesos al tipo de cambio vigente, y que PROCAMPO se traduce en un aumento igual en el ingreso (800

pesos), pero de los hogares productores de básicos. Aunque con diferencias relativas pequeñas, en términos generales PROCAMPO tiene efectos más positivos en los PIBs locales que la devaluación en Napízaro y en Concordia, y lo contrario sucede en el caso de El Chante.[12] Los resultados se deben a las diferencias en cuanto al tipo de hogar más beneficiado con los cambios simulados y a las vinculaciones de tales hogares con la economía local. Por ejemplo, es el caso de las familias de subsistencia y grandes de Napízaro, cuyo ingreso aumenta más con PROCAMPO que con una devaluación de un igual monto; como ellos son los que más vinculación tienen con la economía local frente a los hogares medianos (que son los perjudicados al aplicarse PROCAMPO y no la devaluación), el impacto del esquema gubernamental en el PIB de Napízaro es mayor.

Regresando a las simulaciones sobre los cambios exógenos que, de hecho, han sucedido, los resultados de las simulaciones alternativas a PROCAMPO muestran que hay políticas nacionales distintas y mejores. Estas se ilustran en el cuarto y quinto experimentos para Napízaro, Concordia y El Chante (bajo el título de "alternativa A" y "alternativa B" en los cuadros 4a, 4b y 4c), que consisten en canalizar los mismos montos de recursos que usa PROCAMPO a las actividades productivas agrícolas (alternativa A) o pecuarias (alternativa B) y no a los ingresos de los hogares.[13]

La superioridad de los apoyos a la producción es evidente en los resultados para los tres pueblos: con la alternativa A el crecimiento del PIB de Napízaro se duplica respecto al efecto que sobre éste tiene PROCAMPO (13.1% vrs. 6.55%, cuadro 4a, quinta y cuarta columnas, respectivamente) y con la B el PIB del pueblo crece aún más; el aumento del PIB de Concordia se multiplica por más de seis con cualquiera de las dos aternativas (cuadro 4b) y el factor de expansión del PIB de El Chante es de más de cuatro y de cinco con la alternativa A y B, respectivamente (cuadro 4c).

Conviene notar que con los esquemas alternativos a PROCAMPO son las actividades productivas agropecuarias las que más se benefician (y no el ingreso de los hogares), que el ingreso factorial crece más y que, con la excepción de El Chante, las actividades comerciales aumentan menos que con PROCAMPO.

En lo que respecta a las relaciones de los pueblos con el exterior, los resultados indican que las transferencias que Napízaro y Concordia le hacen al gobierno crecen menos con las dos alternativas a PROCAMPO y se reducen con la alternativa A para El Chante. Por su parte, el aumento en la demanda de productos del exterior se mantiene prácticamente inalterada en Napízaro y Concordia con las alternativas A y B respecto a PROCAMPO, mientras que para El Chante su crecimiento es mayor.

Debido a que los comercios locales de los tres pueblos se dedican básicamente a la venta de productos "importados", las comparaciones anteriores indican que, al

menos para Napízaro y Concordia, las alternativas a PROCAMPO tienen un mayor sesgo a favor del agro que el programa puesto en práctica a partir de la Administración del Presidente Salinas.

Federalismo

La aplicación del federalismo fiscal a San Quintín[14] —el único pueblo de los estudiados que aporta más recursos al gobierno de los que recibe— tendría impactos positivos en su economía, ya que crecería en casi un 3% (cuadro 4d, tercera columna). Todos los componentes de la comunidad se verían beneficiados, los inmigrantes, inclusive. Los beneficios de la aplicación del Federalismo en pobalciones exportadoras como San Quintín no sólo serían mayores que los efectos de la devaluación, sino que, de distribuirse entre sus principlaes agentes (cuarta columna del cuadro 4d), beneficiarían a todos sus componentes y de manera más equitativa que con la depreciación del peso (comparar la segunda y tercera columnas del cuadro 4d).

Los efectos de la crisis y de PROCAMPO en Napízaro, Concordia y El Chante

Hay un marcado contraste en las repercusiones que, en los pueblos agropecuarios estudiados, tienen la combinación de la reducción en los salarios reales, la devaluación y la aplicación de PROCAMPO. El fuerte vínculo de Napízaro con el mercado de trabajo estadounidense, su reducida dependencia en los mercados laborales de México y los beneficios de PROCAMPO hacen que los impactos positivos de la devaluación dominen los efectos de l a crisis salarial, por lo que su PIB crece considerablemente (última columna del cuadro 4a). Concordia enfrenta la situación opuesta y su PIB reciente las adversidades de la reducción de los salarios en México al grado que los recursos de PROCAMPO son insuficientes para lograr que su economía no se deprima (cuadro 4b, última columna). La situación de El Chante es intermedia al sufrir parcialmente los embates de la crisis salarial pero, al recibir los apoyos de PROCAMPO y los beneficios de la devaluación, su PIB logra mantenerse más o menos estable.

Reflexiones finales

Los modelos de multiplicadores aplicados a poblaciones del México rural permiten estudiar los impactos que, sobre el agro tienen y podrían tener cambios en la eonomía y en la política gubernamental de desarrollo.

Si se toman por separado, los efectos de las modificaciones del contexto en el que se ubican los pueblos estudiados tienen el mismo signo: la depresión del salario

real los afecta negativamente y la devaluación y políticas de apoyo al agro impulsan su producción o ingresos. No obstante, el detalle de la información usada y las características del enfoque adoptado permiten obtener resultados precisos, con los cuales es posible conocer las diferencias que tales cambios tienen de pueblo a pueblo y, con ello, hacer un esbozo de tipología al respecto y presentar reflexiones en materia de política.

En principio, aquellas poblaciones pequeñas en las que las remesas de los E.U.A. son fuente importante del ingreso de sus hogares saldrían beneficiadas con la devaluación del peso y con la política gubernamental de apoyo a ellos: es el caso de Napízaro. La crisis salarial no afecta mucho a este tipo de comunidades debido a que la fuerte emigración a los E.U.A. de los miembros de sus hogares las aisla de ella: el efecto de la reducción en el salario real de México es más que compensado por el crecimiento en el valor en pesos de las remesas que reciben. Sin embargo, tal aumento no sólo es función de la depreciación del peso, sino de los recursos que les puedan remitir a sus familias los miembros que trabajan en los E.U.A., y los importantes cambios de actitud y políticas hacia los inmigrantes sucedidos en lo reciente en aquel país no ofrecen perspectivas halagüeñas.

Los pueblos más golpeados por la crisis son los que tienen una importante proporción de hogares que dependen de los ingresos obtenidos por la prestación de los servicios laborales de sus miembros fuera de la localidad, en la región o en el resto de México. Es el caso de Concordia, a la que se le unen otras muchas poblaciones rurales. Frente a las escazas o nulas alternativas de ingreso que en la actualidad ofrece la economía del país, la situación está impulsando la emigración de los habitantes del campo a los E.U.A. o conduciendo a la presión de los recursos naturales rurales. [15]

Por su parte, algunos pueblos con fuentes de ingreso muy diversificadas (como El Chante) estarían logrando sortear los embates de la crisis. Sin embargo, una de éstas fuentes son las remesas, por lo que la prolongación de la crisis puede aumentar las presiones a que sus habitantes busquen trabajo en los E.U.A.

A lo último habría que añadir que son muy fuertes los impulsos de la crisis hacia la emigración al país vecino del norte de los habitantes del agro mexicano. Investigaciones que estiman los impactos de la devaluación en tales flujos indican que ésta podría crecer hasta en más de un 20% (Taylor, J. E. et al: 1997). Aunque no es posible hacer este tipo de estimaciones con los modelos de multiplicadores, [16] los resultados de los efectos marginales de la devaluación en el ingreso de los hogares indican que las presiones a migrar pueden ser muy fuertes (por ejemplo, en términos absolutos, serían mayores para El Chante respecto a Napízaro los efectos en los ingresos de sus hogares de un aumento equivalente en las remesas que reciben).

Por su parte, la devaluación (y el Tratado de Libre Comercio Norteamericano o TLCN) tienen consecuencias positivas en poblaciones dedicadas a la exportación

de productos agrícolas intesivos en el uso de mano de obra. Es el caso de San Quintín, cuyos ingresos y demanda de trabajadores del resto de México han crecido a raíz de la devaluación del peso o del TLCN.

Nuestro estudio también permite hacer una consideración, frecuentemente olvidada en los estudios del agro mexicano: ésta se refiere a los efectos que los cambios en la economía rural tienen sobre el resto del país. Los resultados expuestos indican que una de las consecuencias de la crisis es la disminución de los ingresos que el gobierno recibe del agro y de la demanda que el sector hace a los productos manufacturados que produce el sector industrial de México.[17]

Además de contribuir a proporcionar las bases para elaborar una tipología del medio rural y su contexto, nuestro enfoque permite hacer consideraciones en materia de políticas de apoyo al agro. Así pues, PROCAMPO puede ser una medida para reducir la emigración del agro a los E.U.A., pero los resultados de nuestras indagaciones también indican que hay medidas distintas (igual de neutrales y que usan los mismos montos de recursos gubernamentales), cuyos efectos positivos serían aún mayores. Según ellos, un programa como PRODUCE (el esquema de apoyo a la producción agropecuaria de la Adminsitración del Presidente Zedillo) podría ser más eficáz que PROCAMPO para reducir la emigración e impulsar el desarrollo rural.

Hay un último aspecto importante en materia de política que recoje nuestro estudio. Este tiene que ver con la importancia de tomar en cuenta las prioridades y condiciones locales en el diseño de la política de desarrollo rural. Por ejemplo, los resultados expuestos indican que, para Napízaro, la política más eficáz para promover su PIB (o, lo que es lo mismo, su oferta local) sería la de canalizar los recursos de PROCAMPO a la actividad ganadera. Sin embargo, si fuera más prioritario el impulso del ingreso de los factores laborales (trabajo familiar y asalariado) y la reducción de la emigración, la medida más adecuada podría ser aquella que canalizara los recursos de apoyo gubernamental a la producción de cultivos básicos (ver columnas 5 y 6 del cuadro 4a). En contraste, el apoyo estatal a la ganadería de Concordia provocaría el más alto crecimeitno de la economía del pueblo, así como el más elevado aumento de los ingresos al trabajo familiar (columnas 5 y 6 del cuadro 4b).

La importancia de las diferencias que existen en el funcionamiento de la economía de los pueblos remite al federalismo, una cuestión de suma relevancia para el desarrollo político y socioeconómico de México. En efecto, los resultados del estudio (ejemplificados en el párrafo anterior) fundamentan el argumento de que, en parte, la política económica debe de descentralizarse, ya que sería más eficáz en el cumplimiento de sus objetivos si tomara en cuenta las condiciones y prioridades locales. Una conclusión similar se aplicaría a San Quintín, pues en su caso, la puesta en práctica del federalismo fiscal sería muy conveniente a la

economía local. Lo anterior es especialmente válido cuando se toman en cuenta las condiciones de vida de los inmigrantes y el hecho de que el gobierno las puede mejorar al retornar a ellos parte de los ingresos que recibe de la comunidad en donde trabajan.

En síntesis, lo expuesto refleja la importancia de combinar la política nacional de desarrollo rural con las locales y, en especial, de tomar en cuenta la heterogeneidad en las condiciones de funcionamiento de los componentes del medio rural. Una estrategia de tal naturaleza sería más eficaz para impulsar al agro mexicano, para promover la economía nacional y, en consecuencia, para aligerar las necesidades de emigración que tienen los habitamtes del campo mexicano.

Notes

1. Agradezco el apoyo de los Profesores Richard Sexton y J. Edward Taylor para pasar mi año sabático como profesor visitante de la Universidad de California en Davis, así como los comentarios de E. Taylor.

2. El texto contiene resultados de investigaciones dirigidas por el Prof. Taylor y el autor, que han involucrado el esfuerzo de un numeroso grupo de estudiantes y asistentes. Dentro de ellos, los que han contribuido mayormente están mencionados en las referencias como autores o coautores de artículos o tesis. La investigación ha recibido apoyos económicos de CONACYT, de la Fundación Hewlett, del Pacific Rim Research Program, del proyecto sobre la Reforma Ejidal y de UC-Mexus (las tres últimos programas de la Universida de California).

3. Descripciones detalladas se encuentran, respectivamente, en: Rodríguez González, María del Refugio: 1995, Becerril García, J.: 1995, Taylor, J. E. e I. Adelman: 1996 y Martíbez Guzmán, A.: 1996.

4. En la subsección “Relaciones con el exterior” veremos que el fenómeno se hace más agudo al considerar la recurrencia de los hogares y de las actividades productivas de los pueblos al exterior como fuente de ingreso y de insumos.

5. De hecho, la cifra de 14% para San Quintín es menor, pues el dato tiene un sesgo hacia arriba ya que incluye las ganancias de los negocios grandes y de la empacadora (es decir, de las empresas de corte capitalista) . Es este pueblo, el uso de trabajo familiar está concentrado en los negocios pequeños y en los tianguis o globeros (nombre local que se les da a los comercios ambulantes). Aunque en menor medida, el dato es también algo exagerado para El Chante, pues incluye las ganacias que de hecho tienen los productores de caña. En Napízaro la tierra es un componente importante de su valor agregado debido a la importancia que tiene para el pastoreo del ganado.

6. Es conveniente hacer notar que, aunque el peso del ingreso externo en El Chante y Napízaro es menor que en Concordia, también es muy importante, lo cual se refleja en los ejercicios de simulación abajo presentados.

7. El 77% incluye a las actividades comerciales de Concordia (cuadro 3b). Se precedió de ésta manera porque la mayor parte de las ventas de los comercios del pueblo son de insumos producidos en el resto de México y por la manera en que se constryó su matriz de contabilidad social.

8. El enfoque de multiplicadores tiene sus limitaciones (por ejemplo, con él sólo pueden estudiarse impactos en el ingreso de cambios exógenos y supone que los agentes económicos no reaccionan a cambios en los precios relativos, ver Rodríguez, María del Refugio, *et.al.*: 1996). Sin embargo, a diferencia de los modelos de equilibrio general aplicados —otro enfoque de análisis multisectorial— incorpora situaciones de desempleo, que son realistas en el contexto de la presente crisis de la economía mexicana.

9. En realidad, el efecto de la devaluación en éste poblado sería mayor. Esto debido a que provocaría un aumento en la competitividad de la empresa empacadora, aspecto no captado en el modelo de multiplicadores ya que supone que es constante el volumen físico de sus exportaciones (es decir, en el modelo, lo único que crece con la devaluación son los ingresos en pesos de la empresa).

10. Por razones de espacio no se incluyeron cuadros con los resultados de los efectos marginales de los impactos exógenos. Sin embargo se hará referencia a ellos a lo largo del texto.

11. El resultado coincide con el hecho de que, al basar sus transferencias en las hectáreas cultivadas con básicos y no en la productividad, PROCAMPO beneficia más a los agricultores con tierras menos productivas.

12. Los resultados no se presentan en cuadros por las razones expuestas en la nota 9.

13. Los ejercicios pueden tomarse como representativos de medidas gubernamentales que promuevan la producción agropecuaria mediante la inversión en obras de infraestructura que mejoren las vías de transporte y las comunicaciones de las comunidades.

14. El ejercicio consiste en retornar a la población el excedente que hay entre sus aportaciones al gobierno y los gastos que el último hace en la economía local. Tales desembolsos se distribuyeron entre sus agentes de acuerdo a los pagos que le hacen a las entidades públicas, pero dejando un remanente para transferir algún monto a aquellos que no lo hacen o montos mayores a los que pagan pocos impuestos (hogares de no migrantes y de inmigrantes, respectivamente, ver las dos últimas columnas del cuadro 4d). La base de datos de San Quintín (es decir, su MCS) es preliminar, por lo que los resultados expuestos —tomados de Martínez, A.: 1996— para éste pueblo también lo son. Lo anterior hace que el estudio cuantitativo para San Quintín sea menos completo que el de las otras tres poblaciones.

15. Encuestas que estamos realizando en otras poblaciones confirman lo anterior. Por ejemplo,la crisis en la cosntrucción ha provoado el retorno a su comunidades de los miembros de hogares en pueblos de la Sierra Norte del Estado de Puebla que trabajan como albañles en ciudades cercanas. Como ya hay una enorme presión en los recursos productivos naturales de la Sierra, ésto ha significado la pérdida de una importante fuente de ingreso de muchos de sus hogares y su pauperización, así como el deteriro de su medio ambiente.

16. En ellos la migración se trata como una variable exógena.

17. El descuido contrasta con la insistencia que se hace en la literatura internacional sobre la importancia de los efectos que tiene la situación de la agrícultura sobre el componente industrial de los países en desarrollo. Esto se debe a que en ella se enfatiza la fuerte demanda que el agro tiene de productos manufactureros de origen nacional.

IMPACTS OF MIGRATION

Las remesas de los migrantes mexicanos en Estados Unidos: Estimaciones para 1995

*Fernando Lozano Ascencio**

Introducción

Los cambios en el patrón migratorio entre México y Estados Unidos y las transformaciones en el sistema de envío de remesas durante la primera mitad de los noventa, generaron un incremento considerable en el monto de dinero transferido por los migrantes mexicanos. Según fuentes norteamericanas durante el período comprendido entre 1990 y 1995, el volumen de personas nacidas en México con residencia habitual en Estados Unidos creció en 2.4 millones, al pasar de 4.3 a 6.7 millones de personas (Hansen 1996). Esto significa un crecimiento promedio anual de alrededor de 480 mil personas. De corroborarse estas cifras este incremento constituye una verdadera revolución en la historia de la migración entre México y Estados Unidos.

Por cuanto a las modificaciones en el sistema de envío de remesas entre Estados Unidos y México, el principal cambio ha consistido en el aumento del dinero transferido por vías electrónicas. De acuerdo con el Banco de México, en 1995

casi 1,000 millones de dólares ingresaron al país a través de medios electrónicos. Como un ejemplo de ello, tan sólo el Grupo Elektra en su asociación con Western Union, movilizó 100 millones de dólares en 1994, 440 millones en 1995 y tienen programado transferir 700 millones de dólares durante 1996[1].

El debate en torno a la magnitud de estos recursos también se ha intensificado. En medios académicos se discute no sólo la magnitud de las remesas (Massey y Parrado 1994, Corona 1995), sino también los determinantes económicos y sociales en el envío de dólares, y el impacto de este flujo de divisas en las comunidades expulsoras de migrantes (Massey y Basem 1992, De la Cruz 1995, Durand et.a*l.* 1996a, Durand *et.al.* 1996b). En medios gubernamentales mexicanos, particularmente en el Banco de México, continuamente se revisan y afinan los procedimientos para la estimación de las remesas familiares, sobre todo ampliando la cobertura de captación de estos fondos en el territorio nacional (Carriles *et.al.* 1991, Banco de México 1994:177-178).

En medios gubernamentales de Estados Unidos, también se han desarrollado iniciativas para determinar la magnitud del flujo de divisas generado por los inmigrantes internacionales. Al respecto se han levantado dos grandes encuestas a migrantes que lograron su legalización en 1986, una en 1989 y otra en 1992, en donde, entre otras muchas características sociodemográficas, se puede estimar el monto de las remesas enviadas por los migrantes, al menos del grupo que ha logrado su legalización en ese país (U.S. Department of Justice 1992 y U.S. Department of Labor 1996).

El objetivo de este trabajo es elaborar una estimación del monto de las remesas transferidas por los migrantes mexicanos en Estados Unidos durante el año de 1995, según características de los migrantes y mecanismos de envío. Se pretende actualizar un trabajo previo elaborado por el autor, utilizando fuentes de información y procedimientos similares (Lozano 1993). El trabajo está dividido en tres partes: En la primera se hace una breve revisión de trabajos recientes que estiman el monto de las remesas de los migrantes mexicanos. En la segunda parte se presentan los procedimientos y fuentes empleados en la estimación de remesas para 1995. Y en la última parte se presentan los resultados de este ejercicio, los que se confrontan con estimaciones recientes sobre remesas internacionales captadas en México.

Estimaciones recientes sobre el monto de las transferencias de los migrantes mexicanos

Esta sección está dedicada a la revisión de trabajos recientes que contienen estimaciones sobre el monto de las remesas de los migrantes mexicanos en Estados Unidos[2]. Se comentarán aquí las estimaciones elaboradas por de Massey y Parrado (1994), Rodolfo Corona (1995), por el Banco de México y las contenidas en la

Encuesta a la Población Legalizada (*Legalized Population Survey-LPS*, [U.S. Department of Justice 1992 y U.S. Department of Labor 1996]). La revisión de estos trabajos es central, dado que de ellos proviene en buena medida la información que aquí se emplea para elaborar las estimaciones sobre el monto de las remesas de los migrantes.

Massey y Parrado (1994)

Este trabajo ofrece una estimación del flujo anual de remesas enviado por los migrantes mexicanos, fijando como año de referencia 1990. La información empleada por los autores, proviene de una encuesta levantada entre 1982 y 1992, en 22 comunidades del centro occidente de México. La encuesta ha sido aplicada también a los migrantes de estas comunidades en los lugares de destino de los Estados Unidos. Las estimaciones de remesas incluyen el flujo monetario enviado desde Estados Unidos, así como el monto de dinero que los trabajadores llevaron consigo en sus viajes de retorno a México. Asimismo, la estimación incluye las remesas enviadas por migrantes temporales y migrantes permanentes, ya sean documentados o indocumentados. Los autores estimaron que un total de 24 millones de dólares fue enviado a las comunidades incluidas en la muestra, durante el año del levantamiento. En algunos lugares, este flujo de dinero iguala y aun rebasa el valor del ingreso local. Al generalizar esta cifra para la región del occidente de México los autores estimaron que el flujo regional de "migradólares" ascendió a 1.5 mil millones de dólares. Sin embargo, cuando los autores insertan los datos de su encuesta en el modelo desarrollado por Lozano (1993), el flujo total de remesas estimado es de 2,012.5 millones de dólares, de los cuales 1,167.3 millones (58%) es enviado por migrantes temporales y 845.2 millones de dólares (42%) por migrantes permanentes.

Rodolfo Corona (1995)

Este autor presenta una estimación del monto total de remesas enviado a México por los migrantes en Estados Unidos, tomando como base el año de 1993. La fuente de información empleada es la Encuesta sobre Migración en la Frontera Norte de México (EMIF), levantada entre el 28 de marzo de 1993 y el 27 de marzo de 1994. La EMIF es un conjunto de cuatro encuestas continuas, levantadas en diversos puntos de la frontera norte de México, a poblaciones en movimiento. Estas cuatro poblaciones son: los migrantes que llegan desde el sur a la frontera norte, los migrantes que retornan voluntariamente de Estados Unidos, los migrantes que regresan al sur después de trabajar en la frontera norte de México, y los indocumentados devueltos por la patrulla fronteriza de Estados Unidos.

De acuerdo con Corona la EMIF permite una medición directa del monto de las remesas de dos poblaciones del grupo de migrantes procedentes de Estados Unidos: 1) los migrantes laborales, población de residentes habituales en México, que trabajaron una cierta temporada en Estados Unidos y que retornaron a sus hogares en el interior de la república mexicana, en el año de referencia de la encuesta; y 2) los individuos nacidos en México que residen habitualmente en Estados Unidos y que, durante el año de la encuesta, viajaron temporalmente a México para reunirse con familiares o de paseo.

El monto total de remesas estimado por Corona para 1993 es de 2,055 millones de dólares, de los cuales 1,470 millones fueron transferidos por migrantes temporales (71.5%) y 585 millones (28.5%) por migrantes permanentes. Corona argumenta que su cálculo de remesas está subestimada debido a que la EMIF excluyó dos componentes: por un lado, el dinero que los migrantes llevan consigo, cuya indagación se omitió para evitar rechazos, respuestas incorrectas y no alterar otras partes del cuestionario. De otro lado, no se contempló las remesas de los grupos de migrantes que no son captados por la EMIF. Estos grupos son: 1) los emigrantes permanentes que no retornan de visita a México, 2) los emigrantes permanentes que cuando retornan a México sólo cruzan a las ciudades fronterizas mexicanas, 3) los migrantes laborales que viven en las ciudades fronterizas, y 4) el grupo de migrantes temporales y permanentes no indocumentados que regresan directamente al interior de México por vía aérea.

Banco de México

Antes de 1989, el renglón de remesas familiares de la balanza de pagos de México sólo registraba el dinero captado vía giros postales y telegráficos, de acuerdo con los reportes de la Secretaría de Comunicaciones y Transportes. A partir de 1989, el Banco de México amplió el radio de captación de remesas y consideró también los fondos transferidos vía *money orders* y cheques personales, recibidos en instituciones bancarias y casas de cambio. El instrumento de estimación del monto de *money orders* y cheques personales es la Encuesta Mensual de Remesas Familiares, complementada por el Censo de Remesas Familiares que se llevó a cabo, por primera vez, en agosto de 1990 (Carriles et.al. 1991). La Encuesta Mensual se basa en la información proporcionada por dos instituciones bancarias (Bancomer y Banamex), y el Censo contiene información de todos los establecimientos bancarios y casas de bolsa de México. Para estimar el monto total de los envíos, se conjunta la información muestral con los datos del censo, y se suman las transferencias realizadas vía telégrafo (Banco de México 1991:23 y 264). Estos dos instrumentos de medición (la encuesta y el censo) tuvieron buenos resultados entre 1989 y 1992. El monto anual de remesas estimado durante ese

período fue el siguiente: 1,682 millones de dólares en 1989, 1,980 millones en 1990, 1,852 millones en 1991 y 1,927 millones de dólares en 1992. Sin embargo, en 1993 el marco muestral empezó a presentar problemas, debido entre otras cosas a que las casas de cambio redujeron considerablemente la compra de remesas, a que se amplió la participación de muchas otras instituciones bancarias y comerciales (especialmente en zonas rurales), pero sobre todo, al aumento del monto de remesas vía transferencias electrónicas y al incremento de transferencias en efectivo y en especie (Banco de México 1995).

A partir de 1994 el Banco de México incorporó en la balanza de pagos el monto de las transferencias electrónicas y una estimación de las "transferencias de bolsillo", tanto de efectivo como en especie. La información sobre las transferencias electrónicas es reportada directamente al Banco de México por las compañías dedicadas a esta actividad, por lo que no hay necesidad de hacer algún tipo de muestreo. La información sobre las remesas en efectivo y en especie proviene de una sección especial que se añadió a la Encuesta de Turismo, levantada también por el Banco de México.

Con la incorporación de estos dos rubros, la estimación del monto de las remesas aumentó a casi el doble de lo que se venía reportando: 3,694 millones para 1994 y 3,672 millones de dólares para 1995. Considerando los canales a través de los cuales se efectuaron los envíos durante 1995, el 39.7% se remitió vía mo*ney orders*, 27.1% vía transferencias electrónicas, 24.4% vía giros telegráficos, 8.1% lo constituyen las remesas en efectivo y en especie, y el 0.7% corresponde al envío de cheques personales (cuadro 1). Es significativo el hecho de que pese al incremento del dinero enviado vía transferencias electrónicas, los *money orders* continúen siendo el mecanismo de envío más utilizado por los migrantes mexicanos en Estados Unidos.

Cuadro 1
Remesas familiares estimadas por el Banco de México, según modalidad de envío, 1990-1995 (Millones de dólares)

Modalidad de envío	1990	1991	1992	1993	1994	1995
Total	2,493.6	2,658.0	3,070.1	3,333.2	3,694.3	3,672.7
Money orders	1,375.4	1,215.4	1,026.4	602.8	1,622.4	1,456.3
Giros telegráficos	464.6	524.7	679.7	784.0	888.5	894.5
Cheques	140.2	112.0	221.0	145.6	49.9	26.2
T. Electrónicas					504.2	996.7
Efectivo y especie					629.3	299.0
Ajuste 1990-1993	513.4	806.0	1,143.0	1,800.8		

Fuente: *Dirección de Investigación Económica*, Banco de México

Una vez que los encargados de elaborar estas estimaciones revisaron y afinaron el marco muestral e incorporaron los dos "nuevos rubros" a las estimaciones de 1994 y 1995, se elaboró un ajuste retrospectivo del monto total de remesas, considerando el comportamiento del flujo de remesas durante estos dos últimos años. Las cantidades ajustadas se presentan en el último renglón del cuadro 1. Llama la atención que el total de los montos "ajustados" son considerablemente más altos que los estimados por Massey y Parrado, para el año de 1990 y por Rodolfo Corona, para el año de 1993.

Legalized Population Survey (LPS)

Esta es una encuesta que ha sido levantada en dos etapas, una en 1989 y otra en 1992. La encuesta se aplicó entre la población que logró la residencia legal en Estados Unidos, como resultado de las Reformas a la Ley de Inmigración (*Immigration Reform and Control Act, IRCA*) de 1986. La primera etapa de la encuesta fue administrada entre 6,193 personas, y la segunda entre 4,012 individuos que a su vez respondieron la encuesta en su primera etapa. De esta forma es posible tener un seguimiento de las características de esta población en un período de tres años.

Seleccionando a la población nacida en México que respondió las dos encuestas, se encontró que un total de 1,940 individuos (la cifra ponderada representarían a una población de 596,131 personas) enviaron 733 millones de dólares, de acuerdo con la encuesta de 1989, y 621.5 millones, según la encuesta de 1992. Esta última cifra incluye 109 millones de dólares transferidos en efectivo y en especie (cuadro 2). La disminución en el monto total de remesas enviadas a México corrobora lo que diversos autores han planteado, en el sentido de que a medida que aumenta la permanencia del migrante en el país receptor, disminuye la cantidad y la periodicidad de los envíos de dinero a su país de origen (véase Menjívar e*t.al.* 1996).

Cuadro 2
Estimación del flujo de remesas de la población mexicana que logró su legalización con la *IRCA*, 1989 y 1992

Encuesta	Año	Muestra (individuos)	Muestra Ponderada	Remesas (millones)
LPS1	1989	1,940	596,476	733.0
LPS2	1992	1,940	596,476	510.7

Fuente: *Legalized Population Survey*, 1989 y 1992.

Esta encuesta es muy importante pues contiene información del grupo de migrantes radicados permanentemente en Estados Unidos, respecto de los cuales generalmente se tiene poca información. Además, pese a que el universo de esta encuesta identifica sólo a un grupo específico de migrantes documentados (los legalizados bajo la *IRCA*), confirma un hecho no muy aceptado por algunos autores, en el sentido de que los envíos de los migrantes permanentes son considerablemente altos. Más adelante se retomará la discusión sobre este aspecto.

Procedimientos y fuentes

El procedimiento empleado para la estimación de monto total de remesas captado en México consiste en la construcción de un algoritmo que incorpora diverso tipo de indicadores demográficos y económicos (Lozano 1993). La estimación de remesas se elabora para dos grupos fundamentales de migrantes: los migrantes temporales y los migrantes permanentes. En este trabajo se considera a la población de migrantes temporales, aquella que reside en México y que emigra temporalmente a los Estados Unidos en busca de trabajo, para después regresar nuevamente a México. El grupo de migrantes permanentes se refiere a la población de mexicanos que ha decidido radicar definitivamente en los Estados Unidos.

El conjunto de indicadores demográficos y económicos que se requieren para la estimación del monto total de remesas son los siguientes. Para la población de migrantes temporales, se necesita conocer su volumen, la duración promedio de su estancia en Estados Unidos, la proporción de migrantes que envía dinero a México, el promedio mensual de envíos, la proporción de migrantes que hacen "transferencias de bolsillo" y los montos promedios de esas transferencias. Para la población de migrantes permanentes se requiere información sobre su volumen, tasa de participación dentro de la población mexicana de quince años y más, proporción de migrantes que envía dinero a México, promedios mensuales de envíos, así como información relacionada con sus "transferencias de bolsillo".

La información utilizada en este trabajo proviene de las siguientes bases de datos: Encuesta Nacional de la Dinámica Demográfica 1992 (ENADID), Encuesta de Migración en la Frontera Norte 1993-1994 (EMIF), M*exican Migration Project* 1995, *Legalized Population Survey* 1989 y 1992, y *Current Population Survey*, 1994 y 1995. Además se emplea información de los censos mexicano y norteamericano de 1990, así como del Conteo Mexicano de Población y Vivienda 1995.

En lo que sigue se hará una exposición detallada del procedimiento que se siguió para la selección de cada uno de los indicadores demográficos y económicos. En virtud de que la estimación de remesas es para el año de 1995, algunos de los indicadores fueron ajustados a ese año.

Indicadores para la población de migrantes temporales

Dos son las cifras fundamentales que se requieren para la estimación de las remesas de los migrantes temporales: una se refiere al número de trabajadores que laboraron o buscaron trabajo en Estados Unidos en un año determinado, y la otra se refiere al flujo de retorno de migrantes temporales, es decir, el número de trabajadores que regresó a México durante ese mismo año. Las fuentes de información exploradas fueron la Encuesta Nacional de la Dinámica Demográfica (ENADID) y la Encuesta sobre Migración en la Frontera Norte (EMIF).

En el archivo de Datos Generales de la ENADID, existe una pregunta dirigida a las personas de doce años y más que habitan en el hogar "... ¿alguna vez ha ido [NOMBRE] a los Estados Unidos a trabajar o en busca de trabajo?" (INEGI 1994:365). Si la persona respondía afirmativamente, se le pedía información sobre el mes y el año de su última salida a Estados Unidos, así como del mes y año de regreso (para aquellos que habían regresado). Trabajando la información de este archivo, se encontró que un total de 2'449,045 individuos declararon haber ido a Estados Unidos a trabajar o en busca de trabajo. Dado que el objetivo es determinar el monto de dinero que ingresa a México anualmente, es preciso conocer el volumen de trabajadores temporales que estuvieron en Estados Unidos en un año determinado. La ENADID fue levantada entre el 31 de agosto y el 30 de noviembre de 1992. Para los fines de este trabajo se estableció como período anual de referencia el comprendido entre los meses de noviembre de 1991 y octubre de 1992. Ello permite "aislar" a la población que declaró haber estado en Estados Unidos en algún momento de ese período. En el cuadro 3 se

Cuadro 3
Migrantes temporales residentes en México, según período de entrada y salida de Estados Unidos, noviembre 1991—octubre 1992

Período de entrada y salida de E.U.	Población
1) Migrantes que entraron y salieron de E.U. entre noviembre 91 y octubre 92	191,263
2) Migrantes que entraron a E.U. antes de nov. 91 y regresaron a México entre nov. 91 y oct. 92	177,647
3) Migrantes que entraron a E.U. entre nov. 91 y oct. 92 y no han regresado a México	123,237
4) Migrantes que entraron a E.U. antes de nov. 91 y no han regresado a México	24,188
Total	516,335

Fuente: *Encuesta Nacional de la Dinámica Demográfica*, 1992

observa que 516,335 migrantes temporales estuvieron en Estados Unidos entre noviembre de 1991 y octubre de 1992. Del total de migrantes temporales, 368,910 (71%) regresó a México en algún momento del período de referencia, y los 147,425 migrantes restantes (29%) continuaban en Estados Unidos en el momento del levantamiento de la encuesta.

Por su parte la EMIF estableció que 657,326 individuos, nacidos en México, y que declararon vivir en México, regresaron de Estados Unidos entre el 28 de marzo de 1993 y el 27 de marzo de 1994 (entre abril de 1993 y marzo de 1994 para nuestros fines). De ellos 373,646 migrantes (56.8%), declararon haber entrado y salido de Estados Unidos entre abril de 1993 y marzo de 1994, mientras que 274,163 personas (41.7%) entraron a Estados Unidos antes de abril de 1993 (cuadro 4). Trabajando con la base de datos de esta encuesta se determinó que la duración promedio de estos migrantes en Estados Unidos fue de 9.04 meses. Cabe señalar que esta población no incluye, como en el caso de la ENADID, a los migrantes que habían estado en Estados Unidos en el período de referencia y que no habían regresado a México. Pese a que la EMIF subestima el volumen de migrantes temporales, pues como se señaló, no incorpora a la población que aún se encuentra en Estados Unidos, presenta varias ventajas en comparación con la ENADID[3].

La primer ventaja de la EMIF respecto de la ENADID es que recoge información directamente del migrante, lo que implica una mayor calidad en la información. En cambio la ENADID recoge la información de algún miembro del hogar encuestado, no necesariamente del migrante. Una segunda ventaja de la EMIF es que el cuestionario se aplica justo en el momento en que el migrante está regresando de Estados Unidos (por algun punto de la frontera norte mexicana), en cambio, la ENADID recoge información sobre migraciones que ocurrieron en el pasado, lo cual también representa una desventaja, respecto a la calidad de la información.

Cuadro 4
Migrantes temporales residentes en México, según período de entrada y salida de Estados Unidos, abril 1993—marzo 1994

Período de entrada y salida de E.U.	Población
1) Migrantes que entraron a E.U. entre abril 93 y marzo 94 y regresaron a México en el mismo período	373,646
2) Migrantes que entraron a E.U. antes de abril 93 y regresaron a México entre abril 93 y marzo 94	274,163
3) No declararon mes y/o año de entrada a E.U.	9,517
Total	657,326

Fuente: *Encuesta de Migración en la Frontera Norte*, 1993-1994

En una eventual situación en la que se intentara algún tipo de proyección de la población de migrantes temporales para el año de 1995, utilizando la información de ambas encuestas (ENADID y EMIF), se incurriría en diversos problemas y errores. Por ejemplo, si se asumiera que la población de migrantes temporales presentó un crecimiento constante, entre la mitad de período del año de referencia considerado para la ENADID (1º de mayo de 1992), y la mitad del período considerado para la EMIF (1º de octubre de 1993), ello implicaría un incremento de esta población en alrededor de 25%, hacia la mitad del año de 1995. El problema con este supuesto de crecimiento constante, es que no existe evidencia de que la migración temporal mexicana esté aumentando, y mucho menos al ritmo que esta proyección supondría.

De otro lado, las poblaciones que cada encuesta considera no son estrictamente comparables, pues la ENADID incorpora información de migrantes que se encontraban en Estados Unidos en el momento del levantamiento de la encuesta, y la EMIF no los toma en cuenta. Es por estas razones que se considerará a la población de migrantes temporales reportada por la EMIF, para la estimación del monto de las remesas, bajo el supuesto de que este flujo se mantuvo constante hasta el año de 1995.

Ahora bien, como se intenta establecer el promedio de trabajadores que laboraron o buscaron trabajo en Estados Unidos durante 1995, se considerará el promedio de estancia de 9 meses, reportado por la EMIF, como un indicador clave para calcular el promedio anual de migrantes temporales. El algoritmo sería el siguiente. Al multiplicar la población de migrantes temporales (657,326) por 0.75, factor que expresa que los migrantes permanecieron en Estados Unidos tres cuartas partes del año, es decir, nueve meses, se obtiene un promedio estimado de trabajadores-año en Estados Unidos de 492,995 individuos.

Esta estimación del promedio anual de migrantes, implica un supuesto adicional: que todos los migrantes temporales entraron y salieron de Estados Unidos en un lapso de doce meses. El cuadro 4 destaca que no todos los migrantes entraron a Estados Unidos en el año de referencia de la encuesta. Sin embargo, dada la continuidad de la migración temporal, las estancias de los que estuvieron más tiempo se compensan con las de aquellos que estuvieron lapsos más cortos. Es por ello que para estimar el promedio de trabajadores-año para 1995, no es riesgoso trabajar con el anterior supuesto.

La población estimada en 492,995 trabajadores-año es un insumo básico para estimar el envío de fondos de los migrantes temporales durante sus estancias en Estados Unidos, a lo largo del año de 1995. Sin embargo, en diversas trabajos se ha documentado que los migrantes temporales llevan dinero en su viaje de regreso a México, operación conocida como “transferencia de bolsillo”. Para ello se requiere conocer el flujo de retorno de estos migrantes temporales durante 1995.

Para los fines de este ejercicio, se considerará a la población de 657,326 individuos reportada por la EMIF, para el período comprendido entre abril de 1993 y marzo de 1994, como el flujo de retorno de migrantes temporales. Es probable que el volumen de este flujo haya aumentado en los 21 meses que van del 1º de octubre de 1993 (mitad de período del año de referencia de la EMIF) y el 1º de julio de 1995, mitad del año de 1995. Sin embargo, no se cuenta con ningún otro referente para establecer alguna hipótesis de crecimiento de esa población, situación que podría redundar en una subestimación del monto de las "transferencias de bolsillo" de los migrantes temporales.

Otros indicadores centrales, para la estimación de las remesas de los migrantes temporales, son la proporción de migrantes que realiza envíos de fondos durante su estancia en Estados Unidos, el promedio de dólares enviados al mes, la proporción de migrantes que realizan "transferencias de bolsillo" y el monto de éstas últimas. El cuadro 5 resume la información que al respecto ofrecen las encuestas reportadas en los trabajos de Massey y Parrado (1994) y Rodolfo Corona (1995).

La información del trabajo de Massey y Parrado proviene de encuestas levantadas entre migrantes de 22 comunidades de los estados de Jalisco, Guanajuato, Michoacán y Nayarit, durante 1982 y 1992. Las encuestas fueron administradas tanto en la comunidad de origen, como en los lugares de destino en Estados Unidos. Por esta razón la encuesta considera dos tipos de poblaciones: una, la de migrantes presentes en México que declararon haber trabajado o buscado trabajo en Estados Unidos, y otra, la de migrantes presentes en Estados Unidos. Estas dos poblaciones se ajustan perfectamente a los dos grupos que se han establecido en este trabajo, para la estimación del monto total de remesas. En virtud de que las encuestas se administraron en diferentes años, las cifras en dólares fueron ajustadas por los autores al año 1990. Respecto a la información de los migrantes presentes en México, Massey y Parrado señalan que las dos terceras partes de la población contenida en su muestra, enviaron un promedio de 185 dólares mensualmente. Esta cantidad, a precios de 1995, equivale a 199 dólares (cuadro 5).

Por su parte Corona (1995) trabajando la base de datos de la EMIF estableció que 335,242 personas, o sea el 51% del total de migrantes procedentes de Estados Unidos, envió dinero a México durante los últimos 30 días de actividad económica. Por lo que se refiere al monto de los envíos mensuales, el promedio de dólares enviados durante el último mes de trabajo en Estados Unidos fue de 474. Asimismo, la duración promedio en su lugar de trabajo fue de 8.1 meses. Por tanto la cifra de 320 dólares reportada en el cuadro 5, constituye el promedio de envíos mensuales a lo largo un año. Esta cantidad, a precios de 1995, equivale a 328 dólares.

Para la estimación del monto de las remesas de los migrantes temporales, se consideró el promedio entre las dos encuestas reseñadas en el cuadro 5, tanto para definir la proporción de migrantes que envió dinero a México, como para el monto

* Este dato es necesario para "inflar" o deflactar la información de dólares a un año base, en este caso 1995.

** Valor ponderado. La cifra no ponderada es de 1,991 casos.

*** Esta cifra fue estimada considerando únicamente 18 de las 22 comunidades encuestadas. El total de migrantes es de 876.

mensual de los envíos. Las cifras resultantes, 0.58 como la proporción de migrantes que envía dinero, y 264 como el promedio de envíos mensuales a México, están en un rango bastante aceptable, considerando los resultados a los que han llegado diversos estudios sobre este campo (véase Lozano 1993:50-51). Por cuanto a la información referida a las transferencias de bolsillo, solamente el trabajo de Massey y Parrado recoge datos al respecto. En el mismo cuadro 5 se observa que del total de los migrantes captados en 18 de las 22 comunidades encuestadas, 58% llevó un promedio de 1,087 dólares en su regreso a México (1,166 dólares a precios de 1995). En virtud de que no se cuentan con otras estimaciones, se considerarán estos indicadores para la estimación de las "transferencias de bolsillo" de los migrantes temporales.

Indicadores para la población de migrantes permanentes

Al inicio de esta sección se había definido a la población de migrantes permanentes como aquella compuesta por personas nacidas en México, que radican habitualmente en Estados Unidos, ya sea de manera documentada o indocumentada.

Al igual que con los migrantes temporales, sobre esta población interesa conocer su volumen total, la población susceptible de enviar fondos a México, la proporción que hace envíos, así como el monto de los mismos.

De acuerdo con cifras del Buró de Censos de Estados Unidos, entre 1990 y 1995 el número de personas nacidas en México radicadas en ese país, aumentó de 4.298 millones a 6.721 millones. Nunca, en la historia reciente de la migración entre México y Estados Unidos se había presentado un crecimiento tan espectacular como este. Sin embargo, existen autores que sugieren, que la cifra de 1995, que proviene de la Encuesta Continua de Población (*Current Population Survey CPS*, marzo de 1995), pudiera estar sobreestimada.

Robinson y Hansen (1996) encontraron que la diferencia de 457 mil individuos en la población de mexicanos en Estados Unidos entre 1994 y 1995, al pasar de 6.264 a 6.721 millones entre esos años, no es estadísticamente significativa. De ahí que concluyan que un error de muestreo pudiera estar sobreestimando el volumen de la población de mexicanos en Estados Unidos, y que la diferencia entre 1994 y 1995 no represente el incremento real de esta población. La sugerencia de estos autores es usar con precaución estas cifras, y emplearlas sólo para hacer comparaciones del tamaño relativo de las poblaciones de inmigrantes y no cuantificar diferencias absolutas. Sin embargo, tanto el Buró de Censos, como algunos autores que laboran en esa institución (Hansen 1996), han hecho públicas las cifras de la población nacida fuera de los Estados Unidos, considerándolas como válidas (cuadro 6).

Por su parte Corona y Tuirán (1996) desarrollaron un ejercicio de estimación del saldo migratorio internacional de México entre 1990 y 1995, tomando como base el Censo de 1990 y el Conteo de Población y Vivienda 1995. Con la información sobre el crecimiento natural (nacimientos y defunciones) y la migración interestatal durante el quinquenio 1990-95, y con la información sobre residentes en México del Censo de 1990 y del Conteo de 1995, los autores aplicaron el método residual para estimar el saldo neto de la migración permanente internacional de mexicanos entre 1990 y 1995 por sexo y entidad federativa.

Con base en una serie de ajustes realizados a la población de 1990 (debido a problemas de subcobertura presentes en el censo de 1990), y ajustando la población del Conteo al 30 de junio de 1995, los autores concluyen que el saldo migratorio internacional total ascendió a 1 millón 387 mil personas entre 1990 y 1995 (cuadro 7). Dado que la absoluta mayoría de la emigración internacional mexicana se dirige a los Estados Unidos, Corona y Tuirán sugieren considerar esta cifra como el total de emigrantes permanentes de México a Estados Unidos en esos cinco años. La distribución por sexo es casi equitativa (694 mil hombres y 693 mil mujeres), y los lugares de residencia de esta población en México antes de emigrar definitivamente a los Estados Unidos, corresponden al patrón migratorio conocido: 47.9% residía

Cuadro 6

Fuente: Corona y Tuirán 1996.

en la zona de tradición migratoria, 24.4% en los estados norteños y 27.7% en las entidades del centro de México[4].

El promedio anual de mexicanos que se fueron a vivir a Estados Unidos, entre el 30 de junio de 1990 y el 30 de junio de 1995, fue de 277 mil personas. Este volumen de emigrantes "... equivale a una tasa anual de migración internacional negativa de 0.31%, que, como pérdida neta de habitantes, disminuyó la tasa anual de crecimiento natural del país (2.17% en este quinquenio), fijando así en 1.87% la tasa anual de crecimiento poblacional total de México" (Corona y Tuirán 1996:18).

Con base en la información ofrecida por las dos fuentes anteriores (la *CPS* muestra un crecimiento de la población mexicana en Estados Unidos de 2.423 millones de personas entre 1990 y 1995, mientras que Corona y Tuirán sugieren un crecimiento de 1.387 millones de individuos), en este trabajo se tomará en cuenta la información de la segunda fuente, para la estimación del monto de las remesas de los migrantes permanentes. La elección obedece principalmente a que los errores de muestreo que presenta la *CPS* podrían estar sobreestimando a esta población, y debido a las advertencias de algunos autores a no usar las cifras absolutas de los inmigrantes internacionales de la *CPS*.

La población de migrantes permanentes en Estados Unidos en 1995 quedaría entonces en 5.685 millones, que sería el resultado de sumar la población mexicana residente en Estados Unidos (que de acuerdo con el censo norteamericano fue de 4.298 millones), más la estimación de 1.387 millones de individuos elaborada por Corona y Tuirán. Ahora bien, para la estimación del monto de remesas enviadas por los migrantes permanentes es preciso restar a la población menor de 15 años. Para ello sí fue necesario recurrir a la estructura por edad que ofrece la CPS de 1995. De acuerdo con el cuadro 6, el 10.5% del total de la población mexicana radicada en Estados Unidos son menores de 15 años. Al substraer este último porcentaje a la población total estimada de 5.685 millones, la población de 15 años y más quedaría en 5.088 millones de personas. Adicionalmente, a esta población habría que restarle la población económicamente inactiva y a los desempleados, con el objeto de "aislar" a la población en riesgo de enviar dinero a México. De acuerdo con la *CPS* de 1994, el 58.98% de la población mayor de 15 años es población ocupada.

En cuanto a las visitas que los migrantes permanentes realizan a México a lo largo del año, información necesaria para establecer el monto de sus "transferencias de bolsillo", la EMIF estableció que un total de 499,664 individuos, que declararon vivir en Estados Unidos, y que habían nacido en México, ingresaron a México entre abril de 1993 y marzo de 1994 (COLEF, CONAPO y STPS 1994). Rodolfo Corona (1995:9) los divide de la siguiente manera: 87% declararon haber trabajado en Estados Unidos y el 13% restante no trabajó o no especificó su condición laboral

Cuadro 8
Migrantes mexicanos radicados en E.U. que entraron a México entre abril 1993 y marzo 1994, según condición de trabajo

Condición de trabajo en E.U.	Migrantes	%
No trabajaron en Estados Unidos	64,976	13.0
Trabajaron en E.U. no enviaron	278,185	55.6
Si trabajó y si envió	156,193	31.3
No especificado	310	0.1
Total	499,664	100.0

Fuente: Corona 1995, con base en información de la *Encuesta Sobre Migración en la Frontera Norte 1993- 1994*

(cuadro 8). En este ejercicio de estimación del monto de remesas, se considerará a esta población de migrantes permanentes reportada por la EMIF para estimar sus "transferencias de bolsillo".

Respecto a los indicadores económicos de la población de migrantes permanentes, en el cuadro 9 se recoge información de cuatro encuestas: Le*galized Population Suvey* (*LPS1* y *LPS2)*, *Mexican Migration Project* (*MMP*) y la EMIF. Por lo que se refiere a la proporción de migrantes ocupados que envió dinero a México, de acuerdo con la *LPS1* y la *LPS2*, dicha proporción disminuyó de 0.73 a 0.60 entre 1987 y 1991, que son los años base de las respectivas encuesta. Massey y Parrado encontraron que la proporción de migrantes permanentes que envió dinero a México fue de 0.18, mientras que la EMIF reportó que de los 434,378 residentes en Estados Unidos que visitaron México entre abril de 1993 y marzo de 1994, y que declararon haber trabajado en aquel país, el 36% (156,193 personas) realizó envíos durante su estancia en Estados Unidos. Como se puede observar, el rango de variación de la proporción de migrantes que envía remesas es muy grande (0.73 el valor más alto y 0.18 el más bajo). Sin embargo, dado que la EMIF estaría representando a un universo más amplio de migrantes, pues la *LPS* sólo considera a la población recién legalizada y la encuesta del *Mexican Migration Project* a comunidades de migrantes del centro de México, se consideró pertinente trabajar con la proporción de 0.36 que ofrece la EMIF, para la estimación de las remesas enviadas por los migrantes permanentes (cuadro 9).

Respecto al promedio de dólares enviados al mes, en la *LPS1* la población que envió remesas, transfirió un promedio de 162 dólares al mes, que a precios de 1995 equivaldría a 197 dólares. En la *LPS2*, los mexicanos que sí enviaron remesas,

***** Cifra no ponderada

transfirieron un promedio de 140 dólares al mes, 147 dólares a precios de 1995. Massey y Parrado estimaron el promedio mensual de envíos de esta población en 152 dólares para 1990, 163 dólares a precios de 1995. Corona, por su parte, señala que el promedio enviado por individuo al mes fue de 476 dólares. Sin embargo, esta cantidad fue trasferida a México en un promedio de 1.66 envíos al mes, es decir hubo gente que realizó más de un envío durante el último mes de trabajo. Por tanto "... el monto de cada remesa enviada durante el último mes de trabajo, [...] en promedio ascendió a 334 dólares" (Corona 1995:16).

En el caso del dinero promedio enviado mensualmente por los migrantes permanentes, también se advierte un rango de variación muy grande; además, una de las cifras se "dispara" sensiblemente, la de 488 dólares, reportada por la EMIF.

Independientemente de que las tres encuestas consideran subpoblaciones distintas, del grupo de migrantes permanentes (la *LPS1* y la *LPS2* recogen información de la misma población), las diferencias en las cifras promedio de dinero enviado, pudieran obedecer a la manera como es formulada la pregunta en los cuestionarios. Por ejemplo, la pregunta de la *LPS1* y *LPS2* es: "¿Cuánto del dinero que ganó usted en [1987 ó 1991] mandó a familiares o amigos en otros países? En caso de que el entrevistado tuviera dificultades para responder con una cantidad específica, tenía la posibilidad señalar el porcentaje que mandó a familiares o amigos, respecto del dinero que ganó durante el año. En este caso, la forma de calcular el monto promedio de envíos por mes, es simplemente dividiendo la cifra reportada por el entrevistado entre doce.

En el caso de la encuesta del M*exican Migration Project* la pregunta sobre el envío de remesas (referida al empleo más reciente en Estados Unidos), es ¿cuánto mandaba al mes a su familia en México? A diferencia de la *LPS* que indaga sobre el dinero enviado al *año*, la encuesta del *MMP* formula la pregunta respecto al promedio *mensual* de envíos. Aunque por la estructura de las preguntas pudieran existir variaciones en las respuestas, las preguntas son esencialmente las mismas.

La EMIF tiene dos preguntas ligadas para determinar el monto de los envíos mensuales. Una es ¿durante el último mes de trabajo, cuántos dólares ganó? y la siguiente es ¿de esa cantidad, cuántos dólares envió usted a su país de origen? Por la forma en que está formulada la pregunta, la calidad de la respuesta puede ser muy alta para el mes específico al que se hace referencia. Sin embargo, sería riesgoso suponer que ese nivel de envíos se mantiene, con la misma intensidad, a lo largo de todos los meses del año. De ahí que se haya omitido, en este caso específico, la información de la EMIF. La cifra final que se sugiere como el promedio de dinero enviado a México por los migrantes permanentes, es de 169 dólares, cantidad que es la media de los promedios mensuales reportados por las tres encuestas restantes.

Finalmente, para la estimación de las "transferencias de bolsillo" de los migrantes mexicanos residentes en Estados Unidos, la encuesta LPS2 y el *Mexican Migration Project* ofrecen información al respecto. De acuerdo con la *LPS2*, uno de cada tres individuos encuestados envió regalos y/o llevó consigo dólares en efectivo a México por un monto promedio de 597 dólares en 1991, 627 dólares a precios de 1995. Para el *Mexican Migration Project* sólo una pequeña cantidad de migrantes permanentes (0.03%) llevó dinero consigo a México. La cantidad promedio fue de 789 dólares en 1990, que a precios de 1995 equivaldría a 847 dólares (cuadro 9). En virtud de que la *LPS* es una encuesta diseñada específicamente para conocer las características de la población con residencia habitual en Estados Unidos, se juzgó conveniente emplear la información de esta última fuente para la estimación de las "transferencias de bolsillo" de los migrantes permanentes.

Resultados

Con base en los indicadores económicos y demográficos expuestos en la sección anterior, tanto para la población de migrantes temporales como permanentes, se elaboraron las estimaciones del monto total de remesas transferido por los migrantes mexicanos para el año de 1995. Los resultados se presentan en los cuadros 10 al 12. Por lo que se refiere al monto de las remesas de los **migrantes temporales**, en el cuadro 10 se observa que este grupo transfirió un total de 1,366 millones de dólares, de los cuales 921.5 millones (67.5%) fueron enviados durante su estancia en Estados Unidos, y el resto, 444.5 millones de dólares (32.5%), lo constituye el monto de sus "transferencias de bolsillo".

El cuadro 11 presenta la estimación de las remesas transferidas por los **migrantes permanentes**. Los resultados muestran que los fondos enviados por este grupo

c) Monto promedio de las "transferencias de bolsillo" (dólares)	627
Monto total de "transferencias de bolsillo" (Millones de dólares)	89.9**
Remesas totales de los migrantes permanentes (Millones de dólares)	2,281.5

* El cálculo fue [(a*b*c*12)/1,000]
** El cálculo fue [(a*b*c)/1,000]

ascendieron a 2,281.5 millones de dólares, cantidad que se descompone como sigue: 2,191.6 millones de dólares (96.1%) fueron enviados por estos migrantes desde Estados Unidos, y los 89.9 millones restantes (3.9%) corresponden a sus "transferencias de bolsillo".

El cuadro 12 presenta el resultado global de este ejercicio. De acuerdo con este cuadro, México recibió en 1995 la cantidad de 3,647.5 millones de dólares por concepto de transferencias de fondos de los migrantes mexicanos en Estados Unidos. De este total, el 37.5% fue transferido por el grupo de migrantes temporales y el 62.5% por el de migrantes permanentes. Asimismo, al desagregar los resultados de

Cuadro 12
Estimación del monto total de remesas transferidas según tipo de remitente y forma de envío, 1995

Tipo de remitente	Remesas totales (Millones de dólares)	%
Migrantes temporales	1,366.0	37.5
Migrantes permanentes	2,281.5	62.5
Total	3,647.5	100.0
Forma de envio	**Remesas Totales (Millones de dólares)**	**%**
Envíos desde Estados Unidos	3,113.1	85.3
"Transferencias de bolsillo"	534.4	14.7
Total	3,647.5	100.0

Fuente: Cuadros 10 y 11

esta estimación, de acuerdo con la forma de envío, se observa que el 85.3% fue transferido durante las estancias de los migrantes en Estados Unidos, y el 14.7%, o sea 534.4 millones de dólares, corresponde a las "transferencias de bolsillo".

Discusión y conclusiones

Con el propósito de tener una mejor idea del monto total de remesas estimado en este trabajo, en el cuadro 13 se presentan los resultados de los otros autores aquí reseñados, así como nuestros resultados. Un primer aspecto a comentar se refiere al volumen total de remesas. El cálculo de 3,647.5 millones de dólares es ligeramente inferior al monto estimado por el Banco de México para el año de 1995 (3,672.7 millones de dólares). La diferencia absoluta es de 25 millones de dólares.

Por cuanto al monto transferido por los **migrantes temporales**, el orden de magnitud es más o menos cercano a las estimaciones de Massey-Parrado y Corona. Los primeros autores ubican el monto del dinero enviado por este grupo en 1,167.3 millones de dólares, 199 millones menos que nuestra estimación, mientras que el cálculo de Corona de 1,470 millones, es superior a la estimación aquí elaborada en 104 millones de dólares. Sin embargo, donde las cifras son completamente distintas, tanto en términos absolutos como relativos, es en lo referido al monto enviado por los **migrantes permanentes**. Siguiendo la comparación con los dos trabajos mencionados, Massey y Parrado encontraron que las transferencias de los migrantes

Cuadro 13
Estimación del monto total de remesas transferidas según diversos autores, 1995

Autor y año base de la estimación	Remesas totales (Millones de dólares)	%
1. Massey y Parrado (1990)		
Total	2,012.5	100.0
Migrantes temporales	1,167.3	58.0
Migrantes permanentes	845.2	42.0
2. Corona (1993)		
Total	2,055.0	100.0
Migrantes temporales	1,470.0	71.5
Migrantes permanentes	585.0	28.5
3. Banco de México		
1990	2,493.6	100.0
1991	2,658.0	100.0
1992	3,070.1	100.0
1993	3.333.2	100.0
1994	3,694.3	100.0
1995	3,672.7	100.0
4. Lozano (1995)		
Total	3,647.5	100.0
Migrantes temporales	1,366.0	37.5
Migrantes permanentes	2,281.5	62.5

permanentes ascendieron a 845.2 millones de dólares, que equivale al 42% del total de su estimación para 1990, mientras que Corona fijó ese monto en 585 millones, que corresponde al 28.5% de su estimación total. El cálculo de este trabajo del monto enviado por los migrantes permanentes es de 2,281.5 millones, que representa el 62.5% del total de fondos transferidos a México.

Un aspecto que ha influido de manera decisiva en el incremento del monto de remesas de los migrantes permanentes, es el considerable aumento de la población mexicana que ha emigrado definitivamente a Estados Unidos en los últimos cinco años. Entre 1990 y 1995 la población de mexicanos en Estados Unidos creció en 1.387 millones de personas, según Corona y Tuirán (1996) y en 2.423 millones, según el Buró de Censos de Estados Unidos. Sin embargo, pese a que esta población tiende a reducir la magnitud y la periodicidad de sus envíos a México, conforme pasa el tiempo —tal y como lo expresan los resultados de las

encuestas a la población legalizada (*LPS*)— el monto transferido por estos migrantes continúan siendo muy significativo.

Por último, respecto al impacto económico de las remesas de los migrantes mexicanos se puede decir que, pese a su incremento durante los últimos cinco años, su importancia como fuente de divisas ha declinado. Ello ha sido resultado del crecimiento de las exportaciones mexicanas en los últimos cinco años. En 1990 el valor total de las exportaciones mexicanas fue de 26,773 millones de dólares. Para 1995 esa cifra casi se triplica al ubicarse en 79,541.6 millones de dólares. Por tanto, en 1990, las remesas de los migrantes representaron el 9.3% de las exportaciones totales, mientras que para 1995 su participación se redujo a 4.6% (cuadro 14).

No obstante esta reducción relativa, el monto total de las remesas continúa estando muy cercano al valor de las exportaciones agropecuarias. Pero sin duda el impacto de las remesas de los migrantes debe evaluarse más en términos regionales, ya que sus efectos económicos y sociales son más importantes en aquellos lugares donde la concentración de migrantes es mayor.

Apéndice metodológico

La metodología empleada en este trabajo para la estimación de monto total de remesas captado en México, consiste en la construcción de un algoritmo que incorpora diverso tipo de indicadores demográficos y económicos. Para la población definida como **migrantes temporales**, es decir aquella compuesta por individuos que residen en México y que emigran temporalmente a Estados Unidos en busca de trabajo, la información demográfica y económica que se requiere es la siguiente: volumen, duración promedio de su estancia en Estados Unidos, proporción de migrantes que envía dinero a México, promedio mensual de envíos, proporción de

Cuadro 14
Indicadores seleccionados de la balanza de pagos de México, 1995

Concepto	Millones de dólares	%
Exportaciones de mercancías 1995	79,541.6	100.0
Exportación de Maquiladoras	31,103.3	39.1
Exportaciones petroleras	8,422.6	10.6
Turismo exterior	6,164.1	7.7
Exportaciones agropecuarias	4,016.2	5.1
Remesas	3,647.5	4.6

Fuente: Banco de México, *Indicadores del Sector Externo* y Cuadro 12

migrantes que hacen "transferencias de bolsillo" y monto promedio de esas transferencias. Para la población de **migrantes permanentes**, o sea la aquella compuesta por mexicanos que han decidido radicar definitivamente en los Estados Unidos, se requiere información sobre su volumen, tasa de participación dentro de la población mexicana de quince años y más, proporción de migrantes que envía dinero a México, promedios mensuales de envíos, así como información relacionada con sus "transferencias de bolsillo".

La información demográfica y económica utilizada en este trabajo proviene de las siguientes bases de datos: Encuesta Nacional de la Dinámica Demográfica 1992 (ENADID), Encuesta de Migración en la Frontera Norte 1993-1994 (EMIF), *Mexican Migration Project* 1995, *Legalized Population Survey* 1989 y 1992, y *Current Population Survey*, 1994 y 1995. Adicionalmente se emplea información de los censos mexicano y norteamericano de 1990, del Conteo Mexicano de Población y Vivienda 1995, así como de la Dirección de Investigación Económica del Banco de México. En virtud de que la estimación de remesas que se presenta en este trabajo considera como año base el de 1995, las cifras sobre el monto promedio de los remesas se ajustaron a ese año, con base en la información de *Council of Economic Advisers* (1996).

La estimación de remesas considera la trasferencia de fondos de los dos grupos de migrates mencionados, y toma en cuenta dos formas de envío de dinero: (1) Envíos realizados cuando el migrante se encuentra en Estados Unidos (vía *money orders*, giros telegráficos, transferencias electrónicas o por encargo a terceras personas que viajan a México), y (2) "transferencias de bolsillo", es decir, dinero que es llevado por el migrante en su viaje de visita o de regreso a México. Cabe mencionar que en esta estimación de remesas sólo se consideran las transferencias de fondos de la población nacida en México, y no toma en cuenta los posibles montos enviados por la población México-Americana, omisión que puede contribuir a subestimar el monto total de remesas captado en México.

Notes

*Este artículo es un versión corregida del documento entregado en Septiembre de 1996 a la Comisión para el Estudio Binacional México-Estados Unidos sobre Migración. El autor agradece los comentarios y sugerencias de Gustavo Verduzco, Rodolfo Corona y Jennifer Van Hook durante el desarrollo de este trabajo.

1. El Grupo Elektra tiene establecidas asociaciones comerciales con Woolworth Mexicana, Banca Promex y Banco Internacional para la transferencia de fondos a México. INFOSEL, 11 de enero 1995, 20 de marzo 1995, 2 de mayo 1995 y 27 de febrero 1996.

2. Se trata de estimaciones elaboradas entre 1992 y 1996. Una revisión exhaustiva de trabajos previos que estiman el monto de las remesas de los migrantes mexicanos se puede encontar en el trabajo del autor de 1993.

3. Aunque la EMIF también ofrece información sobre el flujo de migrantes que declaró tener intenciones de internarse en Estados Unidos, población estimada en 797,931 individuos, no hay manera de saber si efectivamente todos entraron a Estados Unidos, ni cuántos de ellos regresaron a México y cuántos permanecieron en E.U.

4. En la EMIF deliberadamente se suprimieron las preguntas sobre las "transferencias de bolsillo" ya que los migrantes hubieran tenido que declarar el supuesto monto de dinero que llevaban consigo en el momento de la encuesta, situación que no se juszgó pertinente (Corona 1995:17).

5. Las entidades consideradas en cada zona son las siguientes. **Tradicional**: Aguascalientes, Colima, Durango, Guanajuato, Jalisco, Michoacán, Nayarit, San Luis Potosí y Zacatecas. **Norte**: Las dos Bajas, Coahuila, Chihuahua, Nuevo León, Sinaloa, Sonora y Tamaulipas. **Centro**: Distrito Federal, Guerrero, Hidalgo, Estado de México, Morelos, Oaxaca, Puebla, Querétaro y Tlaxcala. **Sureste**: Campeche, Chiapas, Quintana Roo, Tabasco, Veracruz y Yucatán. El saldo neto migratorio internacional de la zona Sureste es ínfimo (281 individuos, 0.02% del total).

Responses to Migration

The Bracero Program

Manuel García y Griego

Background

Between 1942 and 1964, the United States and Mexico negotiated several executive agreements which made possible the recruitment of 4.6 million Mexican agricultural workers known as *braceros.*[1] The two governments arranged for the recruitment of railroad workers between 1943 and 1945. They also cooperated extensively in the return of unauthorized migrants to Mexico. During the early 1950s, the Mexican government made modest efforts at patrolling its side of the border and, at Mexico's request, the White House pressed Congress to adopt employer sanctions. The effort backfired and instead Congress adopted the "Texas proviso" in 1952, which exempted employers of unauthorized workers from any sanctions. This exemption was eliminated in 1986. The years between 1942 and 1964 mark the only period during which the two governments jointly managed labor migration between their countries.

The actual operation of the program evolved over time, though certain general features did not change. One or both governments operated migration stations in Mexico where rural farmworkers were selected as *bracero* candidates. From there they were transported to migration reception centers at the border, where grower

representatives hired them for relatively short periods—six weeks in many instances. Their employment and living conditions were regulated by the terms of an agreement negotiated by government representatives, with the U.S. officials representing the interests of farm employers and Mexican officials representing the interests of the *braceros*. Contracts for individual workers occasionally were renewed and extended. Otherwise, at the end of the contract period, workers were returned at employer expense to Mexico.

The recruitment of contract workers through the Bracero Program was accompanied by a parallel flow of unauthorized workers from Mexico. Most of these migrants entered without inspection and sometimes worked for growers that also employed *braceros*. Some also were *braceros* who "skipped" their contracts, thus becoming nonimmigrant overstayers. For a few years after World War II, some illegal entrants working for agricultural employers were legalized and given contracts under the *bracero* agreement. In the years before 1954 the flow of unauthorized migrants was larger—though it is not known by how much—than the movement of contract workers. In the 10 years after 1955, unauthorized migration from Mexico virtually disappeared. The manner in which the Bracero Program was run before 1954 stimulated unauthorized migration; after 1954 it substituted for it.

The Bracero Program offers numerous examples of the pattern of U.S. and Mexican responses to migration issues described in this report. This pattern consists of a triggering event or set of events that provoked debate and led to reactions in one country and counterreactions in the other. Indeed, this pattern repeats itself with small incidents themselves constituting "triggers" that also can be considered part of a broader process of debate, reactions, and counterreactions. Three examples are chosen here that illustrate this pattern: creating the Bracero Program (1941-43), changing the terms of bilateral cooperation (1953-54), and terminating the program (1961-63).

Creating the Program, 1941-43

The events associated with the entry of the United States into World War II constitute the context in which the program came into existence. The United States sought Mexican government cooperation in the use of its neighbor's airspace, the acquisition of critical raw materials, and the establishment of jointly operated listening posts in Mexican territory. To this end the U.S. government agreed to settle pending disputes regarding Mexico's foreign debt and 1938 oil nationalization claims.

Entry into World War II led to a rapid expansion of the U.S. economy, ending the 1930s depression. In 1940 average annual unemployment was still high (14.6 percent). It dropped to 4.7 percent in 1942 and 1.9 percent in 1943. As early as

1941 California growers complained of shortages of harvest labor and petitioned the Immigration and Naturalization Service to admit Mexican temporary workers on an emergency basis, as had been done during World War I.

Triggering Events

Shortly after declaring war on Japan and Germany, the U.S. government created an interagency committee to explore the possibilities of recruiting Mexican agricultural workers. The Mexican government opposed unilateral recruitment on the grounds that the World War I program had not provided sufficient guarantees for migratory workers. Mexican government attitudes toward Mexican migration also had been shaped by unfortunate anti-Mexican incidents during the 1930s. The U.S. government perceived its potential domestic labor shortages as an obstacle in achieving desired levels of production in agriculture and in industries associated with the war effort. It did not want to complicate the wartime alliance with Mexico, however, by recruiting workers unilaterally. Neither did it want to alienate labor organizations, who opposed recruitment just as post-depression wages were starting to rise. The executive branch forged a compromise by reaching a migrant labor agreement with Mexico that met all key Mexican requirements and would be closer to the position of labor organizations. The agreement specified that the U.S. government was the legal employer (growers were subcontractors) and established labor protections in the contract that were consistent with Mexican law and far beyond any U.S. requirements. Because the Mexican government had observed frequent incidents of discrimination against Mexicans in Texas, it prohibited the employment of contract workers in that state for the duration of the war.

Debate, Mexican Reaction, and Counterreactions

Many growers were unsatisfied with the agreement when they discovered that, at least formally, it required certain labor benefits such as the payment of transportation to and from Mexico and living expenses while employed, which they would not have to provide for domestic workers. They lobbied Washington, and in 1943 Congress enacted legislation to provide for an alternative recruitment mechanism, used also for agricultural workers from the Caribbean. This legislation threatened the bilateral agreement, which had been created as the exclusive mechanism for the regulation of Mexican labor migration to the United States. To prevent Mexico's abrogation of the agreement, the State Department decided against the growers and determined that workers could not be recruited from Mexico under

the new legislation. Growers unhappy with the *bracero* agreement had only two other alternatives—to raise wages and make other adjustments that might attract domestic workers, or hire unauthorized workers. For the most part, they chose the latter. The growth of unauthorized migration from Mexico during World War II and afterwards created a new context of public debate and government negotiations in the early 1950s.

Changing the Terms of Bilateral Cooperation, 1953-54

In the early 1950s, the U.S. public and the federal government perceived unauthorized migration from Mexico to have reached crisis proportions. INS apprehensions of Mexican migrants shot up from 64,000 in FY 1945 to 865,000 in FY 1953. The 1951 Presidential Commission on Migratory Labor reported that unauthorized workers took away jobs from domestic farmworkers and caused social problems. Criticism was directed at the U.S. government for not preventing the massive inflow of unauthorized workers at the same time that it expended money to recruit *braceros* in Mexico. U.S. officials blamed the Mexican government for setting unrealistic standards for the administration of the program, for interpreting the agreement unilaterally, and for undermining grower confidence in the program. Mexican government officials blamed the continued flow of unauthorized migrants on the failure of the U.S. Congress to enact employer sanctions. They blamed the growers for hiring and exploiting unauthorized workers. And they defended the bilateral agreement as the most appropriate way to regulate migration and set humane standards for Mexican workers in the United States.

Triggering Events

In 1953 the U.S. embassy in Mexico City sought to persuade the Mexican government to interdict would-be unauthorized migrants at travel embarkation points in the interior of Mexico before they got to the border. The Mexican government refused on the grounds that this would violate constitutional guarantees. The U.S. government also explored briefly the option of stationing troops at the border to prevent illegal entries. The attorney general made a widely publicized "fact-finding" trip to the California border, where he issued statements designed to build public support for later action to stop this migration. Late in 1953 the United States pressed the Mexican government to modify the labor agreement in ways that would make the program more attractive to growers. Mexico refused. The agreement expired, and early in 1954 the United States recruited Mexican workers unilaterally.

Mexican Reaction, Debate, and Counterreactions

The Mexican government issued a public appeal for workers not to go to the United States. It also announced plans to prevent their departure through the use of force. Mexican soldiers patrolled segments of the border with California, and Mexican police and migration officers tried to prevent workers from going through the ports of entry to the United States. This effort ended in spectacular failure. Subsequently the Mexican government relinquished attempts at control, and workers rioted at the border as U.S. authorities were unable to handle all of the people trying to get in. The U.S. comptroller general issued a finding that government expenditures for unilateral recruitment were not authorized by existing law and the recruitment was stopped. Both governments received considerable domestic criticism for their handling of this crisis and returned to the bargaining table.

A new agreement was reached subsequently where almost all U.S. demands were met. Congress passed legislation to authorize the unilateral recruitment of Mexican workers if need be. The two governments also created a commission to settle other pending migration matters, which concluded its work in six months.

Later in 1954, the U.S. government planned and launched the mass deportation campaign known as "Operation Wetback." The Mexican government participated in its implementation by transporting migrants, close to 2,000 per day, from the border to points in the interior. User fees were dropped for employers who hired *braceros*. The United States obtained Mexican government acquiescence to an additional key grower demand: *bracero* contracts for four weeks. Many growers faced with the prospect of interrupted access to unauthorized workers were persuaded to hire *braceros* under new contracts. During "Operation Wetback" large numbers of agricultural employers dropped their previous opposition to hiring contract workers. The Bracero Program was expanded to accommodate much of the previous unauthorized flow. In 1951-52, "there were five apprehensions per *bracero* admission; by 1956-57, there were five *bracero* admissions per apprehension."[2] The new program was attractive to growers in large part because labor guarantees were not enforced.

Terminating the Program, 1961-63

In 1959 a study was conducted for the Department of Labor that persuaded U.S. officials that domestic farmworkers were adversely affected by the bilateral program. That same year the Department tightened the administration of the program significantly, leading to grower protests and starting a steady decline in the number

of workers contracted. In 1960 congressional opponents succeeded in preventing amendments to the program by pro-agribusiness legislators who wanted to curb the secretary of labor's authority over the program. In 1961 the Kennedy administration extended the agreement, though reluctantly, citing adverse effects on the wages and working conditions of domestic farmworkers and the "serious impact in Mexico if many thousands of workers employed in this country were summarily deprived of this much-needed employment."[3] As the Bracero Program was winding down, some growers became less dependent on Mexican contract labor by increasing their use of mechanical harvesters, reorganizing labor activities, and sponsoring the adjustment of some *braceros* into permanent legal immigrants (also referred to as green card workers). U.S. labor unions and public interest groups lobbied for the termination of the program.

Triggering Events

Congressional opposition to the Bracero Program mounted. To the surprise of many observers, in March 1963 the House of Representatives voted to terminate the program.

Mexican Reaction, Debate, and Counterreactions

In response to congressional action, the Mexican government expressed its objections in a diplomatic note. It argued that the agreement did not cause the migration of workers; rather, the agreement was the result of an existing tendency for migration to occur. Eliminating the program would not stop migration. Instead it would produce "a de facto situation" of the "illegal introduction of Mexican workers into the United States." Unauthorized migration "would be extremely prejudicial to the illegal workers and, as experience has shown, would also unfavorably affect American workers, which is precisely what the legislators of the United States are trying to prevent."[4]

In response to these and other concerns, the U.S. Congress postponed the termination of the program by one year, and the last *bracero* agreement expired in December 1964. The Mexican government responded to the anticipated job loss by enacting rules which made it possible for U.S. companies to establish assembly plants (*maquiladoras*) along the northern border. The reluctance of Mexican authorities to accept the U.S. decision to terminate the program was manifested in the decade after the U.S. congressional action of 1963. Shortly before the expiration of the Bracero Program, President-elect Gustavo Díaz Ordaz met with President Lyndon Johnson and raised the possibility of a new migrant labor agreement. Johnson pointed

toward labor union opposition but expressed doubts that U.S. workers would be found to perform the labor of Mexican *braceros*.

> "[O]nce the policy that the American labor leaders want was proved a failure, [the U.S. government] could work out a satisfactory agreement with Mexico."[5]

This did not occur, however, during Díaz Ordaz's administration. His successor, Luis Echeverría, also attempted unsuccessfully to interest the United States government in negotiating a neo-Bracero Program agreement. He gave up at his summit meeting with Gerald Ford in 1974, arguing that a new assessment of the history of the Bracero Program had shown that such an agreement would not protect the labor rights of Mexican workers.

Responses to Migration

Mexico's 1982 Economic Crisis

Francisco Alba

The Eruption of a Protracted Crisis

The Mexican economy suffered a severe breakdown in 1982, which had long-lasting consequences. Before that, from the early 1930s, economic growth was constant (although in 1953, the economy was stagnant at current prices). The GDP in 1982 declined by 0.6 percent and in 1983, the GDP lost an additional 4.2 percent.[1] This deterioration came immediately after a period of economic boom; growth averaged 8.4 percent between 1978 and 1981, a rate of growth that had been achieved only sporadically in the long period of economic growth that prevailed during and following World War II, when annual GDP growth averaged between 6 and 7 percent.[2]

Many observers did not view the 1982 events as the traditional kind of slowdown of the sexennial change of administration. Indeed, the conclusion was that development strategy followed since World War II had run its course. The development strategy, based on import-substituting industrialization (ISI), protection, and government direction, was no longer sustainable. In the 1978-1991 period, the ratio of manufactured imports to exports was roughly 4 to 1. Fundamental disequilibria were present in public finances (the "traditional" or financial deficit in 1982 was 17.7% of the GDP) and in the current account of the balance of payments (in

1981 this deficit amounted to US$ 12.6 billion). Foreign debt had grown to high proportions (more than US$ 90 billion in 1982, equivalent to more than 50% of the GDP) and one devaluation was followed by another in 1982. Foreign debt service in 1982 represented almost half the value of total exports and the debt could not be readily serviced. A deep financial crisis exploded in August. On September 1, 1982, the government took control of the banks. By the end of the 1982, inflation was in the three-digit range (December to December). The 1982 crisis certainly turned out to be more than a debt crisis.

Just as the 1982 crisis was exceptional, so were the measures taken to overcome it. The priority was to achieve basic macroeconomic equilibrium. This adjustment meant: a reduction of economic activity in 1983; a substantial decrease in imports (42%); reduction of domestic private consumption (7.5%), which together translated into a net trade surplus to help service the foreign debt (the current account in 1983 was positive by US$ 5.4 billion). Especially relevant for its potential implications for migration, there was a reduction of domestic wages (depending on the indicator used, wages in 1983 lost between a quarter and a third of their 1982 purchasing power). There was thus an increase in the binational wage differential; the international wage equivalent based on changes in minimum wages using the official exchange rate suffered a depreciation of more than 40 percent in 1982 compared with its 1981 value, and a further depreciation in 1983. Unemployment and underemployment rose in 1982 and 1983. Total employment contracted by 0.3 percent in 1982 and by 2.3 percent in 1983.[3] In summary, GDP per capita in 1983 was about 10 percent below its 1981 level.

Reactions: U.S. Immigration Reform Is Strengthened

U.S. reactions to the Mexican economic events in 1982-1983 took a number of forms. One was that the events in Mexico stimulated U.S. anti-illegal immigration initiatives.[4] Carlos Rico has summarized this point as follows: "During the final stages of the legislative reform process [leading to IRCA], Mexican [migrant] flows once again became an important component in the discussion. This was related to the deepening Mexican economic crisis, which seemed to give credence to those who warned about a veritable flood of people coming into the United States unless something was done to prevent it."[5] The U.S. Executive Branch also reacted and apparently Border Patrol agents were quietly moved from the U.S.-Canada border to the U.S.-Mexico border.

The economic crisis took place amidst a very intense U.S. legislative process with a series of initiatives to control unauthorized immigration. In March 1982, U.S. Senator Simpson and Representative Mazzoli introduced an immigration bill that was passed in the Senate, but was not discussed in the House of Representatives.

The process started again in 1983 and this time the final outcome was close; at the end of 1984, a conference committee could not reach agreement on the Senate and House versions. Data show that in 1983, compared with 1982, apprehensions jumped by 32 percent, from 887,481 to 1,172,306.[6] Line-watch apprehensions also jumped sharply (by almost 46 percent in FY 1983). Line-watch hours also increased, but modestly (by 5.6 percent). Interestingly enough, line-watch apprehensions per hour climbed substantially (by 38 percent), reflecting an increase in attempts to cross the border and, probably, an increase in illegal flows that appear to have resulted from the 1982 decline in the Mexican economy.[7] Apprehensions remained at or above the 1983 level in 1984 and 1985.

In addition to the possibility of new legislative measures subsequent to the Simpson-Mazzoli proposal of 1982 and 1983-1984, there was fear in Mexico that massive expulsions of nationals would take place, and a widespread debate followed on the appropriate countermeasures to deal with this possibility. The extent of this reaction was so important that serious scholars thought it appropriate to calm down the reactions about Mexico's readiness to receive potential expellees.[8]

Toward a Resolution: New Economic Policies and Irca

The resolution of the economic episode that arose in 1982 was achieved through a "new equilibrium" based on measures taken in Mexico and the United States. Although not directly related to the above migratory concerns, the adoption by Mexico of a new development strategy promised to bring an end to the causes of the 1982 economic crisis— the triggering event. The new strategy of opening and liberalizing the economy promised to deliver jobs and wages at least in line with previous patterns and thereby bring migration pressures to more traditional patterns.

The economic adjustment measures of the new Mexican administration (1982-1988) were favorably received by the international financial community. Second, a gradual change of the economic paradigm took hold. Important changes in commercial policy were implemented starting in mid-1985 and were reinforced institutionally by Mexican adherence to GATT in 1986. The change in paradigm was not designed per se to overcome the 1982 economic crisis, but rather to substitute for the old ISI model and to provide high rates of economic growth, making the economy internationally competitive and facilitating a fuller and better allocation of resources, including labor. The promise of the new path was that it would eventually translate into a less unequal structure of rewards and wages, with the obvious migratory implications.

On the U.S. side, the passage of IRCA (also known as Simpson-Rodino law) in 1986 seemed to offer an answer to the phenomenon of unauthorized migration, particularly from Mexico. As a matter of fact, IRCA was not an answer to the

events triggered by the 1982 economic crisis, but it seemed to close a chapter in the U.S. migratory debate initiated in 1971 with the first proposal by Representative Peter W. Rodino. Indeed, IRCA struck a deal between different interests incorporating employer sanctions and a regularization program, but was accompanied by increased resources and personnel for the INS and the Border Patrol to secure better control of the border.

Having reached this resolution to the migratory phenomenon, the situation moved to a different context. The stage was set for a strengthened Border Patrol, a hardening of the official U.S. position, and a modified public debate.[9]

Notes

8. For arguments that do not support a massive return of migrants, see Manuel Garcia y Griego and Francisco Giner de los Ríos, "¿Es vulnerable la economía mexicana a la aplicación de políticas migratorias estadounidenses?" in Manuel García y Griego and Gustavo Vega (comp.) *México-Estados Unidos 1984,* El Colegio de México, 1985, pp. 221-272.

9. This new political official discourse evolved gradually over the 1970s and 1980s, specifically during the early 1980s. As early as 1982, Manuel García described this new discourse under three political concerns: "aquellas relacionadas (1) con los límites económicos y demográficos de la sociedad norteamericana para absorber sin problemas a nuevos immigrantes; (2) con los cambios en el origen nacional de los inmigrantes, tanto

documentados como indocumentados; y (3) con la soberanía y buena administración de la ley y la política migratorias norteamericanas" Manuel García y Griego, "La Comisión Selecta, la administración Reagan y la política norteamericana sobre indocumentados: un debate en transición" in Lorenzo Meyer, *México-Estados Unidos, 1982*, El Colegio de México, 1982, p. 108.

Responses to Migration

IRCA and the Facilitation of U.S.-Mexico Migration Dialogue

Sidney Weintraub

Context

The Immigration Reform and Control Act (IRCA) was enacted in 1986 after an extended period of study and national debate in the United States on the controllability of the border. The Carter administration had proposed comprehensive immigration legislation in 1977, but the Congress showed no disposition to act. Instead, the Select Commission on Immigration and Refugee Policy (SCIRP) was established in 1978, which made its report in early 1981. By then, Ronald Reagan was president and his administration submitted its own legislation, drawing on the Carter proposals and the SCIRP report. There was still considerable reluctance to act.

The members of SCIRP addressed some highly conflictual issues that later became central to the IRCA debate. These dealt with amnesty for persons illegally resident in the United States and a penalty provision for employers who knowingly hired persons illegally in the United States. SCIRP recommended an employer-penalty program, but then voted narrowly (eight to seven, with one abstention) in favor of some form of more secure identification document or documents to

determine the right of persons to be present and work in the United States. The subsequent legislation submitted by the Reagan administration did include an employer-penalty program, but this did not include the adoption of a means of identification that would be difficult to forge. The amnesty provision in the Reagan submission had a January 1, 1980 date for continuous residence of persons illegally in the United States, plus some additional criteria, for eligibility for receiving temporary resident status. The Reagan legislation also proposed a modest temporary worker program.

In the year following this proposal, in August 1982, the Mexican debt crisis erupted and this led to four years of economic decline and stagnation in Mexico. During those four years, the real minimum wage in Mexico declined by some 40 percent as a consequence of the stabilization program in the country. It is hard to precisely determine cause (the Mexican economic decline and reduction in real incomes of Mexican workers) and effect (the impact on Mexican emigration to the United States), but apprehensions did increase from about 900,000 to one million in the years immediately preceding 1982 to 1.2 to 1.3 million a year between 1983 and 1985. Apprehensions soared to 1.7 million in 1986, and then dropped again in the years after IRCA. Whatever reality these apprehensions signified—more border-crossing attempts, more attention to apprehensions by the U.S. Border Patrol, or both—they did revive the issue of loss of control over immigration by the U.S. authorities.

Triggering Events

The SCIRP report, followed by the legislative submission of 1981, laid much substantive groundwork for the discussion that followed on the content of legislation dealing with illegal immigration. The triggering events for IRCA included the economic slowdown in the early years of the Reagan administration prompted by the anti-inflation effort of the Federal Reserve, and the concern raised by the extended economic troubles of Mexico after 1982. The triggering events in this case occurred in the two countries and it was significant that they came after considerable debate within the United States on possible remedial action to curtail illegal immigration. IRCA dealt only with this subject, not with immigration generally.

Debate and Compromise

The grand bargain in IRCA was the adoption of an employer-penalty program advocated by those who wished to curtail future illegal immigration, and the legalization provisions supported by groups who wished to regularize the situation of persons who, while not legally in the United States, had

established their roots there over an extended period. The debate on both parts of the bargain was fierce.

Regularization was seen by its opponents as rewarding lawlessness and inviting more of the same in the future. Penalizing employers for knowingly hiring persons illegally in the United States was seen by its opponents as requiring a form of documentation of Americans that would inevitably lead to human rights violations and discrimination in hiring against Latinos and Latino-looking persons.

The compromises in IRCA around this grand bargain were significant. Employer identification of those persons with a right to work in the United States was based on existing and easily forged documents, like a social security card and driver's permit. As was widely predicted at the time, a thriving business emerged in producing these forged documents. In addition, the INS was less than zealous in implementing the program. The experiment has not been a rousing success in deterring illegal immigration. The outcome might have been the same even if identification of persons had been made more secure and if penalties had been more severe, but this is speculation. The legalization program turned out to be quite substantial. Legalization applications exceeded three million, overwhelmingly of Mexicans (70 percent Mexican of the pre-1982 applicants and 81 percent Mexican under the Special Agricultural Workers program). Around 2.7 million people were actually legalized under the program.

The SAWs program, under which applicants had to demonstrate only three months of qualifying work in the United States during the previous year, was a special concession extracted by agricultural interests. Roughly 1.3 million of the legalization applications came under this program. The pre-1982 program, which based legalization on continuous residence from no later than January 1, 1982, had 1.7 million applicants.

Mexican Reaction

The Mexican authorities reacted to IRCA's passage much as they had to previous U.S. legislative and other U.S. responses to migration matters. They remained largely silent, treating the legislation as an internal matter of the United States about which it would be inappropriate to comment. As described in Volume 1, pages 437 to 509, Mexico for many years consciously adopted a "no-policy" policy toward U.S. migration actions, deliberately refraining from commenting or reacting, other than to protect the human rights of its nationals in the United States.

One other provision of IRCA turned out to have significant consequences in bringing some alteration of this policy, namely, that establishing the Commission for the Study of International Migration and Cooperative Economic Development (often referred to as the Asencio Commission, after its chairman, Diego Asencio). This

Commission was instructed, "in consultation with the governments of Mexico and other sending countries in the Western Hemisphere," to examine the conditions which contribute to unauthorized migration to the United States and to explore "mutually beneficial reciprocal trade and investment programs to alleviate such conditions." The final report of the Commission, *Unauthorized Migration: An Economic Development Response*, was issued in July 1990 and, among other proposals, recommended the establishment of a free-trade area between Mexico and the United States. This was not the only such recommendation, but it was the main one developed with a migration as contrasted with a primarily economic motivation.

The Commission and its staff engaged in an extensive consultation and research program with Mexico and other important migrant-sending countries in the Western Hemisphere. In Mexico, it obtained the collaboration of the Consejo Nacional de Población (CONAPO), the Mexican government's demographic agency, and many universities throughout the country. This cooperation facilitated submissions from Mexican researchers. At the end of the day, in addition to including the research products in appendices to the final Commission report, six volumes, many dealing with the Mexican-U.S. situation, were published commercially by Westview Press in 1991 under the overall title of "Series on Development and International Migration in Mexico, Central America, and the Caribbean Basin."

For a number of reasons, the Commission was able to open a dialogue on migration issues with Mexico that had not been possible before. Some explanations for this accomplishment are that the context was not threatening, but rather developmental in nature; the Commission was a creation of the U.S. Congress, not the executive branch; the interaction was based on joint and parallel studies by Mexicans and Americans; and IRCA itself had established a new reality in U.S. policy toward unauthorized migration. In addition to its discussions with academics, the Commission's consultations included meetings with senior officials of the Secretaría de Relaciones Exteriores (the Mexican Foreign Ministry), Gobernación (the Interior or Government ministry, to which CONAPO reported), the Mexican Senate, and individual members of the Chamber of Deputies, Mexico's lower house. CONAPO had been designated as the main point of liaison for the Commission's research by President Miguel de la Madrid.

New Context

The failure to resolve the identification problem in connection with employer sanctions in IRCA has meant that this issue returned to the table in the 1996 immigration legislation. The main innovation on this issue in the 1996 legislation is the establishment of voluntary pilot programs to verify employment eligibility. The basic program (there are two others) requires new employees to provide their

prospective employers with their social security numbers and, in the case of non-U.S. citizens, their INS identifying information. The employers have three days before hiring to verify the work eligibility of the new employee using a toll-free, electronic confirmation system under which the two numbers will be cross-checked. The pilot programs are voluntary for employers to join, have a duration of four years, and are to be conducted in at least five of the seven states with the largest populations of undocumented immigrants. As is evident from the description, the new pilot programs themselves represent a compromise. They are voluntary and have a time-limited test life.

The legalization program set in motion an inevitable second step for family reunification that will affect legal immigration numbers for 15 to 20 years, or more. The backlogs that will develop are substantial, ranging up to one million and more in FY 1995, and their future progression and reduction will depend on behavior of the legalized residents, particularly the number that naturalize and the nature of their families, and the speed with which visas are issued in the future.

IRCA in retrospect, has had three major consequences: (1) it led to the legalization of status of 2.7 million people, mostly of Mexican origin; (2) it helped open a migration dialogue between Mexico and the United States, but (3) it changed the content of the dialogue as a result of the many family unification visa applications that were made in its wake.

The Never-ending Reform Process

It took ten years between the grand bargain of IRCA to the significant new bargains on illegal immigration in the 1996 legislation. It is evident that the 1996 legislation, because of its own compromises, coupled with the dynamic situation in the U.S.-Mexican relationship, will require revisiting in the relatively near future.

IRCA and the Asencio Commission helped set in play a consultative process between Mexico and the United States that had not existed earlier. The active engagement of the two countries was abetted by the entry into effect of NAFTA on January 1, 1994, and this affected engagement on migration issues as well. One end result of this combination—the contacts made possible by the Asencio Commission and the institutional development under NAFTA—are the proximate parents of the bilateral migration examination of which this case study is a part.

Responses to Migration

The Riverside Incident

Rafael Fernández de Castro

Facts

The incident occurred on April 1, 1996, at the end of a high- speed chase in South El Monte, Riverside County, California. A pickup truck carrying twenty Mexican immigrants who had entered illegally was chased for over an hour by members of the Riverside County Sheriff's Department; when the truck stopped, 18 of them tried to flee. The remaining two, a man and a woman from the state of Michoacán, Enrique Funes Flores and Alicia Sotero Vásquez, although they offered no resistance, were forced out of the truck and clubbed by sheriff's deputies Kurt Franklin and Tracy Watson. Neither of them could understand the commands given to them in English. Funes was beaten half a dozen times, resulting in a fractured arm and other injuries. Alicia was clubbed, pulled by the hair and shoved violently against the truck, but sustained no major injuries.

The chase and the beatings were recorded by KCAL-TV Channel 9 of Los Angeles, and the video was shown to the public in and out of the United States in the immediate aftermath. Both deputies and some alleged eye-witnesses attempted to justify the violence with the argument that the immigrants were hurling pieces of metal and other projectiles at them; this was denied by the immigrants who said that the top of the pickup truck was falling apart. The driver of the truck, the

smuggler or *pollero*, managed to elude the authorities but was apprehended two months later after he tried to bring another group of immigrants illegally into the United States.

Immediate Actions Taken by the U.S.

The two deputies involved were suspended from active duty while the incident was being investigated by the FBI, the Los Angeles County Sheriff's Department, and the Riverside County Sheriff's Department. The investigations focused on the possibility of assault, excessive use of force and civil rights violations. The main witnesses in the incident were law enforcement officers, California Highway Patrol officer Marco DeGennaro (who saw the beatings unfold and audiotaped the deputies shouting at the immigrants), the 18 passengers who were riding in the truck; and motorists who saw the chase on the highway.

On April 4, civil rights attorneys Mark Rosenbaum, David Ross, and Dan Stormer filed a $10 million claim against the Riverside County Sheriff's Department on behalf of Sotero and Funes, alleging that the deputies "recklessly, intentionally and wantonly" beat and kicked them, violating U.S. law, the Vienna Convention on the Law of Treaties and United Nations' conventions against torture.

John Barnett[1] will defend Riverside County deputies arguing that they acted properly, according to the circumstances and based on the premise that the illegal immigrants were putting innocent people's and the deputies' lives in danger by hurling objects at them.

Tracy Watson who said he was coerced by his superiors to write a potentially self-incriminating report following the incident, filed suit against the Riverside Police Department for violating his constitutional rights of due process and legal representation and protection from unlawful detention and self-incrimination.

On April 4, the Immigration and Naturalization Service authorities released the other 18 illegal immigrants who were captured after the freeway chase to the custody of the Mexican Consulate and gave them a special permit to remain in the United States for six months so they could assist in the investigations.

Social Protests

After the incident, several marches and demonstrations were organized in border towns as well as in Washington D.C. by immigrant-rights activists, civil rights organizations, labor unions and liberal political groups. They attributed the actions of the Sheriff's deputies to an anti-Mexican, anti-immigration fervor sweeping the country, and protested the use of unnecessary violence against minority groups in the United States.

Reactions and Consequences

Mexico

Government Secretaria de Relaciones Exteriores (S.R.E.)

The incident caused indignation in both the government and the society as a whole. On April 2, the Mexican government delivered a diplomatic note to the U.S. Department of State, protesting the use of violence and demanding investigation of the incident. The White House responded by asking the Department of Justice to follow the case closely. The same day, the Mexican Ambassador in Washington, Jesús Silva Herzog, and the Consul in Los Angeles, José A. Pescador, sent letters to the Governor of California and to the Riverside County Sheriff demanding a detailed explanation of the incident and that those responsible for the beatings be punished.

The Mexican Consulate in Los Angeles established contact with organizations such as the National Council of la Raza (NCLR), South Western Voters Registration (SWVR), the United States Hispanic Chamber of Commerce (USHCC), and the League of United Latin-American Citizens (LULAC). They in turn sent letters to the President of the United States, to Congress and to Janet Reno, the U.S. Attorney General, condemning the incident and demanding that justice be done.

On April 10, the Mexican Under Secretary for Bilateral Affairs of the Foreign Ministry, Juan Rebolledo, met with U.S. Department of Justice officials in Washington D.C. Rebolledo acknowledged the Mexican authorities' acceptance of President Clinton's program to tighten security at the border to stem the flow of illegal immigrants and asked for:

a) a review of the methods and procedures for applying migration laws in the United States; and

b) intensification of Border Patrol agents' training in human rights.

Again Secretary José Angel Gurría declared that California Governor Pete Wilson's support of Proposition 187 and proposals to extend its ideas to other states, plus anti-migration statements during the presidential and congressional contests, had generated a climate of intolerance in the United States against immigrants. He also declared that the Mexican government has committed itself to increase its efforts to protect the rights of Mexicans, whether legally admitted or not, living in the United States, through Mexico's 40 consulates. He said that the presence of Mexican consular authorities will be augmented at detention centers where immigrants who entered illegally are held, and will open a center in California and other border states where human rights violations claims could be filed.

On April 16, Mexico, through the Foreign Ministry, appealed to the Human Rights Commission of the United Nations for a special conference on the rights of migratory workers and their families, and proposed a resolution to condemn the violation of human rights of migrants.

Congress

On April 9, the incident was debated in the Mexican Congress by deputies and senators from major parties, the PRI, PAN, PRD, and PT.[2]

(a) Main agreements. A joint congressional resolution was issued[3] which demanded that President Zedillo make public the list of human rights violations committed against Mexicans in the United States in the past five years. These had been recorded by the 40 consulates, and had been kept secret to avoid damaging the bilateral relationship. The executive responded on April 11 by publishing the list of human rights violations against co-nationals in a document titled: "Protection of Mexican Citizens Living in the United States," The list intended to demonstrate that the United States had fallen into a systematic pattern of human rights violations against Mexicans.

(b) Criticism of the Executive. The opposition argues that the Mexican government is responsible for the migration problem because of its inability to create enough jobs in Mexico. It criticized President Zedillo and Secretary Gurría for what they consider to be a lack of consistency in defending the rights of illegal workers in the U.S. and for their weak response to the Riverside incident. The opposition demanded that President Zedillo make migration a priority of the country's foreign policy. An independent representative declared that the United States is carrying out a low-intensity war against Mexican citizens living in the United States, as well as creating a hostile anti-immigrant climate along the border. He accused the Clinton administration of militarizing the border.

Social Reactions

Human Rights organizations in Mexico demanded that President Zedillo suspend all migration agreements with the United States and create in their place a bilateral agreement to reduce migratory movements. The then Director of the National Commission of Human Rights in Mexico, Jorge Madrazo, agreed to help the Mexican consulates in the United States in the defense of the rights of illegal immigrants.

The incident had significant effects on the domestic scene. The human rights issue was sensitive because of recent violations committed against peasants commemorating Emiliano Zapata's death in Tlaltizapan, Morelos. An earlier serious

violation had occurred in Guerrero. Mexicans have been sensitized to human rights violations committed against immigrants from Central and South America caught trying to enter Mexico illegally or to cross the country en route to the United States. Such incidents of repression weakened President Zedillo's position that he is turning Mexico into a law-based country.

The United States

In the United States, two facts made the Riverside incident particularly significant. On the one hand, the incident bore many similarities to the 1991 beating of the African-American Rodney King, which had raised important social issues such as the growing intolerance of white police toward minority groups. On the other hand, the Riverside incident occurred at the outset of a national electoral campaign and with important migration bills pending in Congress. During 1996, legislators discussed at length the social and economic costs of migration. The 1996 immigration legislation focused primarily on limiting illegal immigration.

The incident coincided with the end of the primary elections. Senator Robert Dole used the migration issue to gain votes in states like California. Dole supported the proposal to deny public education to children illegally in the United States because of what he said was the "most expensive mandate of all times" under which the federal government forces the states to assume these education costs.

The incident made evident, once again, a problem of legal jurisdiction. Local law enforcement agencies are frustrated because there is nothing that a state or local law enforcement agency can do about a violation of immigration other than calling the local Immigration and Naturalization Service (INS) officer to report the case, and local and state officers can merely accompany the INS on patrols of the US-Mexican border. By contrast, INS officials have powers not given to local police. For instance, they can interrogate any person believed to be an alien, board ships in US waters to search for immigrants seeking to enter illegally, and can patrol private lands within 2.5 miles of the border to search for undocumented people.

Counteractions by the U.S. Government

The U.S. Department of Justice agreed:

a) with Mexico's request to conduct the review of the methods and procedures for applying migration laws with local police along the U.S.-Mexico border;

b) to give the Mexican authorities a full report on federal actions in the Riverside and Temecula[4] cases.

Congress

On April 10, Chicano members of Congress met and supported an agreement on migration between the two countries that would deal with the protection of immigrants. Among them, Lucille Roybal, Esteban Torres, and Javier Becerra declared that one of their roles in Congress is to work vigorously in order to counterbalance the anti-immigration climate.

Civic Reactions

On April 17, the President of the U.S.-Canada Human Rights International Association, M. Hale, urged the United States to sign the International Convention of Human Rights. The Director of the Los Angeles Coalition for the Rights of Immigrants, Susan Alva, demanded the creation of an independent commission to investigate police abuses against Latinos in all the counties of Southern California.[5]

For Bilateral Relations

On May 8, at the 13th Meeting of the Binational Commission, a Memorandum of Understanding (MOU) dealing with the protection of the rights of Mexican nationals in the United States was signed by Secretaries Angel Gurría and Warren Christopher. It can be claimed that this MOU represents a new binational understanding reached as the result of the sequence of reaction and counter-reaction produced by the Riverside incident. This case study also shows the high sensitivity in Mexico—the executive, congress, the opposition parties, and the media—towards the violation of human rights of co-nationals in the United States. Similarly, many Americans were annoyed with the hate messages and columns against Mexico in the media, especially given the numbers that cross the border. It is evident that there exist some highly sensitive areas in bilateral affairs, such as immigration, where the traditionally antagonistic and mutually recriminating attitudes still prevail.

Notes

1. The lawyer who defended the officials charged with beating Rodney King in Los Angeles in 1991.

2. Partido Revolucionario Institucional (PRI), Partido Acción Nacional (PAN), Partido de la Revolución Democrática (PRD) and Partido del Trabajo (PT).

3. This was the first joint resolution ever achieved by the leading party with the opposition.

4. On April 6, a truck full of illegal immigrants rolled over in Temecula, in the Riverside County, killing seven and injuring 18 people.

5. Similar to the Christopher Commission created in 1992 to investigate the Rodney King case.

Responses to Migration

Selected Court Cases on Immigration Enforcement

Sidney Weintraub, Francisco Alba, Rafael Fernández de Castro & Manuel Garcia y Griego

Supreme Court decisions unless otherwise indicated

(including case, year, holding, and significance).

Selected Court Cases on Immigration Enforcement

(Supreme Court decisions unless otherwise indicated.)

	Cases (Year)	Holding	Significance
Stops & Searches at/near border			
Roving Patrols	*Almeida-Sanchez v. U.S.* (1973)	Without probable cause, the warrantless search of petitioner's automobile away from the border or its functional equivalent violated the Fourth Amendment guarantee against unreasonable searches and seizures.	Limited the power of INS roving patrols to stop and search vehicles away from the borders.
	U.S. v. Brignoni-Ponce (1975)	Except at the border and its functional equivalent, Border Patrol officers may stop vehicles only if they are aware of specific articulable facts, together with rational inferences that would reasonably warrant suspicion that the vehicles are occupied by aliens who may be illegally in the United States.	Court found that a roving border patrol that stops a vehicle near the Mexican border and questions its occupants concerning their immigration status and citizenship where the occupants' apparent Mexican ancestry furnished the only ground for suspicion that the occupants were aliens violates the Fourth Amendment.
	U.S. v. Cortez (1981)	Based upon the whole picture and taking account the experience of Border Patrol officers, the Court found that objective facts and deductions from such facts afford a legitimate basis for suspicion of a particular person and action on that suspicion.	Court recognized that, when used by trained law enforcement officers, objective facts, meaningless to the untrained, allow for permissible circumstantial evidence suggesting that a particular vehicle is involved in criminal activity may provide a sufficient basis to justify an investigative stop of that vehicle.

	Cases (Year)	Holding	Significance
	Cervante-Cuevas v. INS (9th Circuit 1985)	The exclusionary rule did not apply to a deportation proceeding even if it was assumed that the detention of the alien was unlawful.	
	Nicacio v. U.S. INS (9th Circuit 1985)	Appearance and dress factors were not sufficient to provide for a reasonable suspicion that the people in the vehicle were illegal aliens sufficient to justify motor vehicle stop. Subjective feelings or intuition do not provide any rational basis for distinguishing illegal aliens from U.S. citizens and legal aliens, and thus do not meet the requirement that stops of vehicles to search for illegal aliens be based on specific articulable facts, together with inferences from those facts.	While an officer may evaluate the facts supporting reasonable suspicion in light of his experience, experience may not be used to give the officers unbridled discretion in making a stop. The detaining officers must have a particularized and objective basis for suspecting the particular person stopped to be an illegal alien. The articulable facts standard is "measured against an objective reasonable man standard, not by the subjective impressions of a particular officer."
	Gonzalez-Rivera v. INS (9th Circuit 1985)	The stop, which resulted solely from Gonzalez's Hispanic appearance, constituted a bad faith and egregious violation of the Fourth Amendment.	Allowed application of the exclusionary rule in deportation hearing.
Traffic checkpoints/ fixed checkpoints	*U.S. v. Ortiz* (1975)	Warrantless searches at fixed checkpoints not the equivalent of an external border may only be conducted on the same probable cause basis as established in other search and seizure cases.	Court applied probable cause standard to traffic checkpoint searches. Court recognized the differences between a roving patrol and a fixed checkpoint, but argued that there is no difference in the actual search.
	U.S. v. Martinez-Fuerte	Vehicle stops at a fixed checkpoint for brief questioning of its occupants, even though there is no reason to believe the particular vehicle contains illegal aliens, are consistent with the Fourth Amendment. The operation of	

	Cases (Year)	Holding	Significance
		a fixed checkpoint need not be authorized in advance by a judicial warrant. It was constitutional for the Border Patrol, after routinely stopping or slowing automobiles at a permanent checkpoint, to refer motorists selectively to a secondary inspection area, to be questioned about citizenship and immigration status on the basis of criteria that would not sustain a roving-patrol stop. No constitutional violation even if such referrals were made largely on the basis of apparent Mexican ancestry.	
Searches & Seizures away from the border			
Factory sweeps/ workplace raids	*International Ladies" Garment Workers' Union v. Sureck* (9th Circuit 1982)	The work force at a plant was seized for the duration of an INS survey because the stationing of agents at the doors of the building was such that a reasonable person would have believed he was not free to leave.	The court found that the agents had created a detentive environment by their verbal authority, badges, use of the element of surprise, the sustained disruption of the working environment, and questioning of selected individuals based on their clothing, facial appearance, hair color and styling, demeanor, language, and accent. The ILGWU court noted that an individual could be questioned only on the basis of a reasonable suspicion or probable cause that that particular employee was an illegal alien.
	INS v. Delgado (1984)	INS agents, moving systematically through a factory and inquiring as to the practice of sealing off the citizenship status of workers while other agents were stationed at each	Delgado overturned ILGWU. The Court characterized the INS factory exits as a non-threatening interrogation device, rather than detention.

	Cases (Year)	Holding	Significance
		exit, did not effect a seizure of the entire workforce in violation of the Fourth Amendment. The individual questioning of the employees did not amount to a detention or seizure under the Fourth Amendment.	
	INS v. Lopez-Mendoza (1984)	The Fourth Amendment exclusionary rule does not apply to civil deportation hearings.	Court limited its holding by stating "we do not deal here with egregious violations of Fourth Amendment or other liberties that might transgress notions of fundamental fairness and undermine the probative value of the evidence obtained."
Pedestrian stops/area control operations	*Terry v. Ohio* (1968)	Police officer who observed unusual conduct in light of his experience that criminal activity might be afoot and that the persons with whom he is dealing may be armed and presently dangerous, and who approached, identified himself as an officer, and asked their names, acted reasonably in seizing defendant in order to search him for weapons, and did not exceed reasonable scope of search in patting down outer clothing of defendants.	Though case did not arise in an immigration context, it is relevant to immigration enforcement regarding pedestrian stops and area control operations. The scope of the search must be "strictly tied to and justified by" the circumstances which rendered its initiation permissible. The holding concerns the balancing test used to determine the reasonableness of the intrusion on the individual. The test weighs the need for the intrusion against the severity of the invasion caused by the intrusion.
	Brown v. Texas (1979)	The application of the Texas statute to detain appellant and require him to identify himself violated the Fourth Amendment because the officers lacked any reasonable suspicion to believe appellant was engaged or had engaged in criminal conduct.	The circumstances did not justify a reasonable suspicion that defendant was involved in criminal conduct and thus did not warrant detention for questioning.

	Cases (Year)	Holding	Significance
Residences/farm & ranch checks of migrant housing	*Zepeda v. U.S. INS* (9th Circuit 1985)	The court affirmed the lower court's findings that INS practices violated the Fourth Amendment and that the INS could reasonably be expected to continue these practices. The court also found that the district court abused its discretion when it prohibited the INS from obtaining the assistance of other law enforcement agencies.	
	LaDuke v. Nelson (9th Circuit 1985)	Practices of INS in conducting farm and ranch checks of migrant housing constituted seizure of the housing community where access roads were sealed, means of egress from individual units were surrounded, and those who left were seized.	LaDuke is distinguished from Delgado: (1) here, INS agents operated without warrants, probable cause or articulable suspicion; and (2) there was a materially different place in which the searches occurred—homes versus the workplace.
Other			
Admissibility of information	*Benitez-Mendez v. INS* (9th Circuit 1983)	"even though…petitioner's arrest violated the Fourth Amendment, the information obtained as a result of the arrest (petitioner's statements on Form I-213) was admissible at his deportation hearing." 760 F.2d 907, at 910.	Applied in Cervantes-Cuevas.
"Substantial connection"	*U.S. v. Verdugo-Urquidez* (1990)	The Fourth Amendment does not apply to the search and seizure by U.S. agents of property owned by anonresident alien and located in a foreign country.	Aliens are entitled to constitutional protections when the test is applied that they may have come within the territory of the United States to develop substantial connections with this country. This holding potentially eliminates Fourth Amendment protections for illegal immigrants altogether by requiring their connection to the

	Cases (Year)	Holding	Significance
			United States be tested against the "substantial connection" test.
Collateral challenge to deportation proceedings	*U.S. v. Mendoza-Lopez* (1987)	Under the due process clause of the Fifth Amendment, "a collateral challenge to the use of a deportation proceeding as an element of a criminal offense must be permitted where the deportation proceeding effectively eliminates the right of the alien to obtain judicial review."	
Miranda issues & right to challenge deportation	*U.S. v. Gonzalez Sandoval* (9th Circuit 1990)	Border Patrol agents' failure to give defendant Miranda warnings when they questioned him about his immigration status did not make his post-Miranda confession involuntary, absent evidence that the defendant was coerced into confessing after receiving warnings. No entitlement to automatic grants of continuance requests is implied in the right to attack deportation proceedings collaterally. Before a district court's denial of continuance will be reversed, "the appellant must establish that the refusal resulted in prejudice to his defense." *U.S. v. Long,* 706 F.2d 1044, 1053 (9th Circuit 1983)	Nontestimonial physical evidence discovered as a result of statements obtained in violation of Miranda is not inadmissible as "fruit of collaterally poisonous tree" where there is no evidence of coercion or denial of due process in elicitation of the statements.

Responses to Migration

On the Unrenounceability of Mexican Nationality

Sidney Weintraub

In December 1996, three articles (30, 32, and 37) of the Mexican Constitution were modified to open the possibility to all Mexicans to keep their Mexican nationality, even though they choose to take another one. The aim of the legislation is twofold. One is to permit Mexicans to reside in another country and still maintain roots in their country of birth. The second is to remove any obstacle—real or perceived—that might limit their full advancement and legal protection in their country of adoption.

According to the constitutional changes, no Mexican by birth can be deprived of Mexican nationality, except in a few specific instances; and acquiring another nationality is not one of these. These changes have yet to become law because Mexican States are in the process of ratifying them.

These constitutional changes create a status or norm that will provide new obligations and rights. Mexican secondary laws will regulate or determine the specific rights of those who possess another nationality. The aim here is to avoid conflicts derived from possessing double, or multiple, nationality. These conflicts might arise in such fields as taxation and property rights, and extradition and political rights. On this point, it is worth mentioning that in the interim—until the

corresponding secondary laws are changed—the current Nationality Law (Ley de Nacionalidad) continues to be the law of the land in matters not contradicting the above-mentioned changes.

Mexican legislators believe that as many as two million Mexicans lost their Mexican nationality by voluntarily adopting another one. To Mexicans in such conditions, the Mexican Congress offers remedial actions. If these Mexicans are in full legal standing (*se encuentran en pleno goce de sus derechos*), they can regain their Mexican nationality just by asking (*previa solicitud*) the Ministry of Foreign Relations (SRE) within the next five years, after these changes become law. The number of Mexicans who meet these conditions could be rather small, however, because, according to some experts, just a few people actually have explicitly renounced their Mexican nationality.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan, Chair, U.S. Commission on Immigration Reform Before the U.S. Senate Committee on the Judiciary Subcommittee on Immigration and Refugee Affairs August 3, 1994

Mr. Chairman, members of the subcommittee, thank you for providing this opportunity to report on the work of the U.S. Commission on Immigration Reform.

The Commission was created to assess and make recommendations regarding the implementation and impact of U.S. immigration policy. Mandated in the Immigration Act of 1990 to submit an interim report in 1994 and a final report in 1997, the Commission has undertaken public hearings, fact-finding missions, and expert consultations to identify the major immigration-related issues facing the United States today. I am pleased to share our preliminary findings and recommendations with you today. Our report, which will be submitted on September 30, will provide fuller details on these recommendations and the reasons we are making them.

The process undertaken by the Commission has been a complex one. Distinguishing fact from fiction has been difficult, in some cases, because of what has become a highly emotional debate on immigration. We have heard contradictory testimony, shaky statistics, and a great deal of honest confusion regarding the impacts of immigration. Nevertheless, we have tried throughout to engage in what we believe is a systematic, nonpartisan effort to reach conclusions drawn from analysis of the best data available. The recommendations that I present today have been adopted unanimously.

Principles Underlying Work of the Commission

Certain basic principles underlie the Commission's work. We decry hostility and discrimination towards immigrants as antithetical to the traditions and interests of the country. At the same time, we disagree with those who would label efforts to control immigration as being inherently anti-immigrant. Rather, it is both a right and a responsibility of a democratic society to manage immigration so that it serves the national interest.

The Commission believes that legal immigration has been and can continue to be a strength of this country. Most legal immigrants are the spouses, children, parents, or siblings of a U.S. citizen or long-term permanent resident. A smaller number are sponsored by U.S. businesses that need their skills and talents. While there may be disagreements among us as to the total number of immigrants that the United States can absorb or the categories to whom the U.S. should give priority for admission, the Commission agrees that legal immigration presents many opportunities for this nation.

That is not to say that the Commission is unmindful of the problems that may also emanate from immigration. Too many have abused the very hospitality that we grant so freely. Unlawful immigration is unacceptable. Enforcement measures have not sufficiently stemmed these movements. Failure to develop more effective strategies to curb unlawful immigration has blurred distinctions between legal and illegal immigrants. Many communities legitimately fear that they have lost the ability to integrate the diverse range of individuals and families who enter heir communities. The Commission is particularly concerned about the impact of immigration on the most disadvantaged within our already resident society--inner city youth, racial and ethnic minorities, and recent immigrants who have not yet adjusted to life in the U.S.

For the Commission, the principal issue at present is how to manage immigration so it continues to be in the national interest. Managing immigration presents a number of challenges:

- How do we ensure that immigration is based on and supports broad U.S. economic, social, and humanitarian interests rather than the interests of those who would abuse our immigration laws?

- How do we manage our borders while still encouraging international trade, investment, and tourism?
- How do we maintain a civic culture based on shared values while accommodating the diverse population admitted through immigration policy?

It will be impossible to reach answers to these questions unless our policies and their implementation are more credible. As far as immigration policy is concerned, credibility can be measured by a simple yardstick: people who should get in, get in; people who should not enter are kept out; and people who are deportable should be required to leave.

The Commission is convinced that immigration can be managed more effectively and in a manner that is consistent with our traditions, civil rights, and civil liberties. As a nation of immigrants committed to the rule of law,

this country must set limits on who can enter and back up these limits with effective enforcement of our immigration law.

Recommendations

The problem of unlawful immigration will not be solved by quick fixes. There are no panaceas. Nor will this problem be solved cheaply. If the nation is serious about controlling illegal immigration, it must commit substantially more resources than are currently available to accomplishing the measures required. The U.S. must also more effectively target existing resources on strategies that are most likely to prevent unlawful immigration from occurring. In sum, curbing unlawful immigration requires:

- Better border management;
- A more effective method of deterring the employment of unauthorized workers;
- A consistent policy regarding eligibility for public benefits;
- A willingness and ability to remove those who have no right to remain in the country, with particular focus on criminal aliens;
- An enhanced capacity to respond to immigration emergencies;
- An effective strategy to reduce the pressures for migration in sending countries; and
- Better data for making and implementing policy.

No one approach will be sufficient to address unlawful migration.

Let me touch on the highlights of this comprehensive strategy that the Commission will be recommending in its September report.

I. Preventing Unlawful Entry and Facilitating Legal Entry Across U.S. Borders

The Commission believes that significant progress has been made during the past year in identifying and remedying some of the weaknesses in U.S. border management. Nevertheless, we believe that far more can and should be done to meet what we consider to be the twin goals of border management: preventing illegal entries while facilitating legal ones.

Land Borders

The Commission supports enforcement strategies aimed at prevention of illegal entry at the border rather than

apprehension following illegal entry.

The Commission was favorably impressed with the pilot program in El Paso, Operation Hold the Line. Prevention holds many advantages: it is more cost-effective than apprehension and removal, it eliminates the cycle of voluntary return and reentry that has characterized unlawful border crossings, and it reduces potentially violent confrontations between Border Patrol officers and those believed to be seeking illegal entry.

Prevention strategies require a combination of additional personnel, improved technology and communications, data systems that permit quick identification of repeat offenders, additional equipment including vehicles, and a political commitment to this approach. Prevention also requires a capacity to anticipate changes in smuggling patterns. The Commission recommends development of contingency plans to handle smuggling at new locations along the border as well as increased sea smuggling that may arise as land border controls are improved. The Commission also recommends formation of a mobile, rapid response team that can be deployed when new avenues of illegal entry are identified. The Commission supports use of unscalable physical barriers only as a last resort in border control, if they are needed to reduce violence at the border.

The Commission supports efforts to increase training for Border Patrol officers, improve procedures for adjudicating complaints of Border Patrol abuses, and provide redress or relief to those subjected to improper actions. And, recognizing the fundamental shift in Border Patrol policy that a prevention approach requires, the Commission recommends systematic evaluation of the effectiveness of the new border strategies adopted by INS.

The Commission recommends additional resources for inspections at land border ports of entry in order to facilitate legal entry.

Legal entry should be facilitated in order for the country to benefit from trade and tourism. The Commission also believes that an intregal part of controlling illegal entry is facilitating legal entries. When Operation Hold the Line was instituted, it became apparent that a portion of those crossing the river illegally had or were eligible for legitimate Border Crossing Cards [BCCs] but found it was slower and more difficult to cross through the port of entry. In particular, high priority should be given to easing traffic through inspections posts and expediting issuance of BCCs. The Commission is giving consideration to a user fee to be imposed on crossers of the U.S. border as a possible way to provide additional funds to facilitate land border management. Consideration also is being given to a fee for issuance of the BCC, now precluded by U.S.-Mexico treaty. Also, further steps need to be taken better to ensure that the BCC is not misused by legal crossers who are engaged in unauthorized employment. The Commission's recommendations regarding employer sanctions should help in this regard.

The Commission supports increased coordination between the governments of the U.S. and Mexico on border issues.

The Commission views favorably the discussions underway between the U.S. and Mexican federal governments and border state and local governments. These discussions provide forums to promote greater cooperation between the two governments in solving problems of such mutual concern as border violence, violations of Mexican exit laws and U.S. entry laws, movements of third-country nationals through Mexico to the United States, smuggling of people and goods, and similar issues.

Airports

As with land borders, ***the Commission supports a combined facilitation and enforcement strategy that would prevent the entry of unauthorized aliens while facilitating legal admissions at U.S. airports.***

The Commission supports the use of new technologies to expedite the inspections process and improve law enforcement. We also commend and urge continuance of the government-airline industry discussions and recommendations for preflight inspections and more efficient processing of travelers with Machine Readable Documents. The Commission supports efforts to devise programs that enhance the capacity of airline carriers to identify and refuse travel to aliens seeking to enter the U.S. on fraudulent documents. We encourage the INS and the airlines to continue the Carrier Consultant Program and other coordinated efforts to maintain complete, accurate and reliable Advance Passenger Information System [APIS] data and improved lookout data systems.

The Commission heard testimony from the airline industry on what they consider to be undue fines and penalties imposed for transport of unauthorized aliens. The Commission recommends development of a system for mitigation of penalties or fines for those carriers that cooperate with the INS and show actual reductions in the number of unauthorized aliens they carry. The Commission further believes that carriers should not be responsible for the actual physical custody of inadmissible air passengers.

Coordination of Border Management

The Commission urges careful monitoring of coordination among agencies with responsibility for

border management.

In a June 1993 report, GAO outlined efficiency and other management problems with the INS-Customs dual inspection structure on primary inspection at land border stations. Among them: poor coordination; lack of updated cross-designation training; lack of joint performance studies; no coordinated approach for addressing staffing imbalances and traffic backups; a substantial interagency rivalry; and weakened operational accountability due to the dual structure. Even though the report focused on land border ports-of-entry, the same problems occur at air ports-of-entry as well.

More recently, the National Performance Review noted, in reference to previously voiced suggestions, that a reorganization of the agencies at this time was too extreme and that the agencies should continue to work in the existing structure, with the assistance of present interagency work groups. In two years, the existing structure is to be reevaluated. The Commission plans to monitor whether the coordination mechanisms recommended

by the NPR help address the recurrent management problems experienced in land and airport immigration inspections and border control. If they do not make the needed improvements, the Commission will recommend further actions.

Antismuggling Efforts

The Commission believes an effective prevention strategy requires enhanced capacities to combat organized smuggling for commercial gain.

The Clinton Administration introduced legislation in July 1993 that enhances penalties for smuggling or harboring aliens for commercial advantage or financial gain and includes organized smuggling under the provisions of RICO. The legislation also provides expanded authority for seizure and forfeiture of property related to smuggling activities and enhanced authority for wiretaps. The Commission supports the basic approach taken in this legislation, and we recommend, as well, enhancement of intelligence gathering and diplomatic pressures to prevent smuggling rings from operating.

II. Deterring the Employment of Unauthorized Aliens

Employment continues to be the principal magnet attracting illegal aliens to this country. As long as U.S. businesses benefit from the hiring of unauthorized workers, control of unlawful immigration will be impossible. The Commission believes that both employer sanctions and enhanced labor standards enforcement are essential components of a strategy to reduce the job magnet.

Verification of Employment Authorization

At the heart of many of the problems in current application of employer sanctions is the verification process used to determine work authorization. Widespread counterfeiting of documents that can be used for verification of identity and employment authorization has been reported since IRCA's implementation. It is also relatively easy to obtain genuine documents, such as birth certificates or drivers licenses, by fraudulent means. Moreover, confusion about the verification procedures and wariness about the validity of the documents has led to great potential for discrimination against foreign-looking and -sounding citizens and legal immigrants.

The Commission recommends development and implementation of a simpler, more fraud-resistant system for verifying authorization to work.

In examining the options for improving verification, the Commission believes that the most promising option for more secure, nondiscriminatory verification is a computerized registry, using data provided by the Social Security Administration and the Immigration and Naturalization Service.

The key to this process is the social security number. All workers must already provide a social security number upon taking employment. The verification process that the Commission is looking at adds a step to this existing requirement: checking that the social security number is valid and has been issued to someone authorized to work in the United States.

This verification system will reduce the time, resources, and paperwork spent by employers in abiding by the requirements of immigration law. It also should reduce any potential for discrimination. Employers would no longer have any reason to ask if a worker is a citizen or an immigrant--the only relevant question is: "What is your social security number?"

The Commission further recommends that the President immediately initiate a program to implement this new verification process in the five states with the highest levels of immigration. The President already has the authority to do this in the Immigration and Nationality Act. The initiative should incorporate a number of features.

First, employers will need a way to determine that the individual about to be hired is actually the person with that social security number. We have received conflicting testimony about the best way to check the applicant's identity. We have heard proposals for a more secure social security card, counterfeit-resistant drivers license, and telephone verification system. The pilot program presents an opportunity to determine what is the most cost-effective, fraud-resistant and nondiscriminatory method.

Second, the pilot and any resulting legislation to establish the system on a permanent basis must provide protection against use of the verification process for purposes other than those specified in law. The Commission shares the civil liberties concerns of many in this country that the process for verifying employment authorization not become the basis for a national identity system. We believe the same system could be used, without damage to civil liberties, for verifying eligibility to receive public benefits. However, no one should be required to carry a card, should one be used, or present it for routine identification purposes. There must also be significant penalties for inappropriate demands for the identification.

Third, the verification system should protect the privacy of the information included in the registry. The Commission is aware of the proliferation of databases and of reported abuses of privacy by both government and private agencies. The verification process should contain explicit provisions for protecting privacy and the computer system should incorporate appropriate safeguards.

A final word on the verification process--to be effective, the computerized registry will draw on data from the INS and the Social Security Administration. A prime prerequisite of this system is the integrity of those data systems. Both agencies will need to improve their own records, speed up the entry of new data into their own systems and transfer of the necessary information to the jointly maintained registry, and ensure that the information remains accurate and accessible. INS has already requested funding to undertake these improvements in its recordkeeping. If Congress is serious about curbing unlawful immigration, it is essential that the funds be provided to carry out this initiative. The Commission is working with SSA and INS to get cost estimates for instituting the proposed registry and will report its findings in September.

Antidiscrimination Efforts

The Commission believes that adopting a more secure, simpler verification process for determining work authorization--and, in particular, one where employers will no longer have to make any determination as to immigration status--is the best defense against discrimination.

The current verification process creates discriminatory behavior among employers even in cases where

no discrimination is intended or in which there is an explicit effort to avoid illegal conduct. In particular, employers ask for different or additional documentation from those who appear to be foreign-looking or

-sounding. The abuse of documentation requirements is harmful in and of itself and also masks more egregious discriminatory actions.

The Commission encourages the Office of Special Counsel for Immigration Related Unfair Employment Practices to undertake targeted investigations to document discriminatory actions and provide relief for the citizens and legal immigrants who find themselves victims of discrimination based on national origins or citizenship status. We believe there is a public responsibility to provide effective redress for those who experience discrimination resulting from immigration law. During the transition period to a new verification system, in particular, OSC should be proactive in identifying discriminatory practices, finding ways to prevent their occurrences to the extent possible and seeking penalties against those employers who do discriminate. Further, the Commission recommends that additional studies be undertaken to determine the effectiveness of the new verification process in reducing discriminatory behavior.

Enforcement of Employer Sanctions and Labor Standards

The Commission believes that reduction in illegal immigration requires vigorous and complementary enforcement of employer sanctions and labor standards.

Neither employer sanctions nor labor standards enforcement has received sufficient priority. Both have suffered loss of resources during the past few years. Even within existing budget, however, a better targeting of resources could improve enforcement.

The Commission recommends that INS target its employer sanctions resources on the investigation and prosecution of likely violators of the provisions against knowing hire of illegal aliens and seek the full use of current penalties against them. When the new verification process takes hold, INS also should eliminate investigation of paperwork violations in order to concentrate more effectively on businesses that knowingly hire unauthorized aliens or fail to verify work authorization.

The Commission supports an increase in labor standards enforcement efforts in industries with large numbers of illegal aliens. Deterring unlawful immigration is a key ingredient in protecting U.S. workers. The presence of large numbers of unauthorized aliens in certain industries renders enforcement of labor standards, such as wage and hour and child labor provisions, all the more difficult because unauthorized workers are afraid to demand better working conditions or report infractions and businesses can bypass the hiring of workers who would be more cognizant of their rights.

A Memorandum of Understanding was signed last September between the Labor Department and the INS setting out a division of responsibility for investigation of employer sanctions violations. The Commission urges the Attorney General and the Secretary of Labor to review the current division of responsibilities between the Justice and Labor Departments in the enforcement of employer sanctions and labor standards and make needed changes if the new MOU does not provide the coordination needed.

The Commission also supports establishment of national and local taskforces to promote greater coordination in enforcement of labor standards, employer sanctions, and antidiscrimination provisions.

The Commission further recommends that educational efforts by the Immigration and Naturalization Service, the Office of Special Counsel, and the Department of Labor regarding employer sanctions, antidiscrimination provisions, and labor standards be coordinated and continuing, sending a single message about the rights and responsibilities of workers and employers.

III. Making Benefits Policy Consistent with the Objectives of Immigration Policy

Eligibility for Benefits

Immigrant eligibility for public benefits has become a major focus of debate in the United States. The Commission believes that decisions about eligibility should support the objectives of our immigration policy: to deter unlawful immigration and to support lawful immigration and eventual citizenship. Using these objectives as a measure of benefit policy, we have come to the following conclusions:

Illegal aliens should not be eligible for any services or assistance except those made available on an emergency basis or for similar compelling reasons.

Benefits policies should send the same message as immigration policies. Aliens should not have entered the U.S. unlawfully and, if they did, should not receive public-funded aid except in very unusual circumstances: where there is emergent need for specific assistance; where there is a public health, safety or welfare interest (such as immunizations, child nutrition programs and school lunch programs); and where their eligibility is constitutionally protected. The verification system recommended by the Commission should be used to determine eligibility for public benefits as well as work authorization.

Legal permanent residents should continue to be eligible for needs-tested assistance programs.

The U.S. admits legal immigrants with the expectation that they will reside permanently in the United States as productive residents. U.S. immigration law bars the entry of those who are likely to be a public charge. It also contains provisions for the deportation of individuals who become public charges within five years unless they require aid for reasons that developed after entry, such as an unexpected illness or injuries sustained due to a serious accident. The Commission believes that these provisions should be made more effective. At the same time, we also recognize that circumstances may arise after entry which create a pressing need for public help. The Commission is not prepared to lift the safety net out from under individuals who, we hope, will or have become integral parts of our civic culture. We recommend against any broad, categorical denial of such protection to legal immigrants on the basis of their alienage.

However, ***the Commission strongly endorses initiatives to ensure that sponsors are financially responsible for the immigrants they bring to this country. In particular, the Commission believes that the Affidavits of Support signed by sponsors should be legally enforceable.***

Mechanisms should be developed that would permit public aid offices to recover support from sponsors who abandon their financial responsibility. Should these initiatives prove successful, deeming provisions may no longer be needed since sponsors will be required to provide actual support or repay the costs of assistance provided to those they sponsor.

The Commission recommends that the eligibility of aliens for public benefits and work authorization be defined in the Immigration and Nationality Act. The Commission would further require that every alien who is permitted to remain in the country on a temporary or permanent basis through legislation, court order, or administrative order be classified as to his or her eligibility for benefits and authorization to work.

The Commission believes that benefit eligibility determinations are complicated by the myriad statuses now afforded to individuals within this country. While the rights of lawful permanent residents, refugees, and asylees have been spelled out in immigration and benefit laws, the Executive Branch, Congress, and the courts have created various other statuses that may or may not denote benefit eligibility. The INA should specify categories of aliens by their work and benefit eligibility, such as: those eligible for work and needs-tested benefits; those eligible for work and only those benefits that accrue from employment; and those eligible for neither. Every alien should then be assigned to one of these categories.

Impact Aid

The Commission recommends a short-term authorization of financial aid to offset at least a portion of certain identifiable costs to states and localities resulting from unlawful immigration.

Difficulties in enforcing immigration law have created fiscal impacts that would not have occurred had enforcement

strategies been more effective. The ineffective enforcement has been due, in some measure, to a lack of political will on the part of decisionmakers, including officials in states now heavily affected by illegal immigration.

The Commission believes that the federal government has a responsibility to help mitigate the fiscal costs of unlawful immigration, particularly through renewed efforts to reduce unlawful immigration. We recommend a short-term authorization of financial aid to states until such time as the enforcement measures take effect, contingent on the following conditions: better data and methods to measure the net fiscal impact of illegal immigration and reimbursement of only identifiable costs; a mechanism designed to ensure that governments do not expect or become dependent on this interim measure as a continuing source of funding; and a requirement that state and local governments cooperate with federal authorities to enforce the immigration laws of the United States.

IV. Facilitating Identification and Deportation of Criminal Aliens

An effective procedure for prompt and permanent removal of aliens ordered deported is an essential part of a credible deterrence policy. If people unauthorized to enter believe that they can remain indefinitely once having reached the interior of the nation, they may be more likely to come. The Commission is reviewing the full range of issues raised by U.S. exclusion and deportation procedures and plans to issue a separate report on this subject in FY 1995. For the present, we are limiting our specific recommendations to the removal of criminal aliens who represent the most serious threat to public safety.

The top priority of interior enforcement strategies should be the removal of deportable criminal aliens from the U.S. in such a way that the potential for their return to the U.S. will be minimized.

The Commission supports the Institutional Hearing Process [IHP] as an effective mechanism to ensure that deportable criminal aliens are identified and receive final orders of deportation while still serving their sentences. The IHP is cost-effective in that criminal aliens can be deported directly from state and federal prisons, alleviating INS' need to detain them until deportation proceedings take place. The Commission commends the negotiations taking place between federal immigration authorities and state correctional departments to enhance the efficiency of the IHP. Resources should be increased for investigations to identify criminal aliens and for the hearing process itself.

The Commission is concerned, however, about the ease with which deported criminal aliens can effect a reentry into the United States, particularly those who are returned to the Mexican border communities. In the case of Mexico, deported criminal aliens who have served their sentences should be repatriated to the interior of the country, rather than simply to the border, to lessen the likelihood of their return. The Commission also supports the use of bilateral treaties encouraging the transfer of criminal aliens to serve sentences in their own countries; the Department of State should monitor cases to be certain that sentences are served.

The Commission recommends that the federal government assume responsibility of the costs of incarcerating illegal aliens through reimbursement, by transferring the illegal aliens to federal facilities, and/or by negotiating with foreign governments to accept and incarcerate their nationals who are criminal illegal aliens.

Enhanced federal responsibility in this area will serve two purposes: to help mitigate the costs incurred by states and localities resulting from unlawful immigration; and to help facilitate the prompt deportation of illegal aliens who have committed criminal acts in the United States.

V. Increasing Capacity to Respond More Effectively to Emergency Movements of People

The Commission believes that effective immigration policy requires the capacity to respond effectively and humanely to immigration emergencies, a capacity not now in place.

Since 1980, the United States has received hundreds of thousands of people who left their own countries or entered this country under emergency circumstances. The exodus of Haitians is only the most recent example. Emergencies can

overwhelm resources and create massive problems that remain long after the emergency is over.

The Commission held an expert consultation in Miami in which we heard many concerns about U.S. policy. Since then, a number of new policy directives have been issued. New asylum regulations, the establishment of safe havens in the region, new regulations for the Immigration Emergency Fund are three important developments in this area. The Commission plans to assess these efforts as well as other policies required to enhance U.S. capabilities in responding to immigration emergencies. We will issue a separate report during FY 1995 which will include discussion of contingency planning, refugee processing, asylum procedures, temporary protected status, aid to communities experiencing emergency arrivals of aliens, and other related issues.

VI. Addressing Unauthorized Migration at the Source

The Commission firmly believes that greater attention must be paid to the causes of migration in countries of origin as part of a strategy to deter unauthorized migration to the U.S.

Much as we support an enhanced enforcement effort by the United States, the Commission believes that unauthorized immigration will not be curbed by unilateral U.S. action alone. Effective deterrence of unlawful immigration must get to the root causes of these movements. Getting to these causes will require cooperation with other countries. While the U.S. clearly retains the sovereign right to protect our borders, migration is by definition an international phenomenon and international actions are needed to address it.

The Commission recommends that the United States give priority in its foreign policy and international economic policy towards long-term reduction in the causes of unauthorized migration to the U.S. The Commission also recommends adoption of near-term strategies targeted at reducing migration pressures in selected communities with high emigration rates.

In addition to these efforts, the Commission supports an enhancement of intelligence-gathering capacities to improve early warning of unauthorized migration. While the root causes of migration are readily discernible, it is harder to predict what specific factors will precipitate actual movements into the United States. Particularly with regard to immigration emergencies, intelligence is needed as well to assess the potential size and duration of the emergency, the mode of entry, the location to which migrants will come, and other characteristics of the emergency.

VII. Improving Data

Improved policy development and implementation require better data. Throughout the Commission's own inquiry, we have found it difficult to assess the effects of immigration policy and immigration itself because of inadequacies in the data. The Commission is working with the InterAgency Working Group on Immigration Statistics to develop specific recommendations to improve data collection. These recommendations will be detailed in our September report.

Looking Beyond 1994

As the members of the Committee know, the Commission is at a mid-point in its work. Our longer-term agenda is to assess and make recommendations about the implementation and impact of the Immigration Act of 1990. The Commission has already begun a systematic fact-finding process to measure the economic, social, demographic, and foreign policy effects of immigration. We considered whether to make recommendations in our September 1994 report about the legal immigration system, including the numbers and criteria for admission. We have decided not to do so at this time. The data needed to assess the full ramifications of current legal immigration policy are not available. The Immigration Act of 1990 was not implemented until 1992, meaning that we have only two years worth of data and little experience with its impact to use in determining its effects. An important new aspect of the law--the Diversity Program--has not even at this time been implemented.

The Commission will issue a progress report on legal immigration as part of its September report to Congress. We will continue to examine its effects during 1995. Should the Commission determine that any changes in legal immigration

policy are in order, we will report our recommendations expeditiously.

I would be pleased to answer any questions you may have.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan
Chair, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on Ways and Means
Subcommittee on Human Resources
August 9, 1994

Mr. Chairman, Members of the Subcommittee, thank you for providing me the opportunity to testify this afternoon on the recommendations of the U.S. Commission on Immigration Reform. The Commission was established by the Immigration Act of 1990 to assess the implementation and impact of U.S. immigration policy. The Commission will present its first report to Congress on September 30, 1994. That report will focus primarily on steps needed to restore credibility to U.S. immigration policy and its enforcement.

While our mandate does not extend to the broad range of issues that this Committee is considering regarding welfare reform, there is an overlap in one area: immigrant eligibility for public benefits. I am pleased to share our preliminary findings and recommendations on this issue in the hopes that they will help inform your debate on welfare reform.

I would first like to say a few words about the Commission itself. We are a bipartisan group composed of nine members. I was appointed to the Commission by President Clinton. My eight colleagues were appointed by the Democratic and Republican leadership of the two houses of Congress.

Our work has not been easy. Distinguishing fact from fiction has been almost impossible, because of what has become a highly emotional debate on immigration. We have heard contradictory testimony, shaky statistics, and a great deal of honest confusion regarding the impacts of immigration. Nevertheless, we have tried throughout to engage in what we believe is a systematic, nonpartisan effort to reach conclusions drawn from analysis of the best data available. The recommendations that I present today have been adopted unanimously.

The Commission believes that legal immigration has been and can continue to be a strength of this country. Most legal immigrants are the spouses, children, parents, or siblings of a U.S. citizen or long-term permanent resident. A smaller number are sponsored by businesses that need their skills and talents. We take an affirmative decision to admit these individuals. It is with the expectation and desire that they will be integrated immediately into our social community and, eventually, through naturalization, into the political community as well.

The Commission believes that a clear and consistent policy on eligibility for public benefits is key to a credible immigration and welfare policy. The United States has the sovereign authority to make distinctions as to the rights and responsibilities of the various persons residing in its territory. We believe that distinctions regarding eligibility for public benefits should be consistent with the objectives of our immigration policy-to support legal immigration in the national interest and to deter unlawful entries.

As far as legal immigrants are concerned, this logic has brought the Commission to a strong and, as I mentioned, unanimous conclusion: legal permanent residents should continue to be eligible for needs-tested assistance programs. U.S. law already bars the entry of those who are likely to become a public charge. We recognize, however, that circumstances may arise after entry which create a pressing need for public help-unexpected illness, injuries sustained due to a serious accident, loss of employment, a death in the family. The Commission is not prepared to lift the safety net out from under individuals who, we hope, will become integral parts of our social community. We, therefore, strongly recommend against any broad, categorical denial of eligibility for public benefits to legal immigrants on the basis of their alienage.

At the same time, the Commission strongly endorses initiatives to ensure that sponsors are financially responsible for

the immigrants they bring to this country. If an immigrant cannot show that he or she has financial resources or a job in the U.S., the immigrant's sponsor must demonstrate a capacity and intention to support the new arrival. This is done through an affidavit of support. At present, this affidavit is a morally-binding document. The Commission believes that the affidavits of support signed by sponsors should be legally enforceable, with contingencies made if the sponsor's financial circumstances change significantly for reasons that developed after the immigrant's entry-for example, if the sponsor sustains a serious injury that prevents him or her from working. Mechanisms should be developed that would ensure that sponsors provide the support that they have promised.

While the Commission does not reject the concept of deeming, we do not believe deeming alone is the best way to ensure sponsor responsibility. We heard testimony that deeming can merely shift costs from one level of government to another. The immigrant is ineligible for federal programs, but he or she may retain eligibility for state and local benefits. Even if the federal government extends to states the authority to deem, a number of state constitutions would appear to preclude that action. Alternately, deeming leaves the immigrant whose sponsor abdicates responsibility with no financial resources at all. A legally-binding affidavit of support helps address both of these problems.

The Commission also recommends changes in immigration law to address more effectively violations of our public charge provisions. As I stated, when new circumstances arise after entry, we must maintain the safety net. However, when immigrants become dependent on public programs within the first five years after entry for reasons that existed before entry, they are legally deportable. We must have a greater capacity to enforce our law in this regard. At present, to prove deportability, the government must show that 1) the immigrant received public assistance, 2) the government billed the immigrant for these services pursuant to a specific statute, and 3) the immigrant failed to repay the funds. This standard is inappropriate given the way that public benefit programs work. The Commission recommends instead that deportability on the grounds of public charge be measured by sustained use of the public benefits and not on the basis of a government request for repayment of the aid.

The Commission believes that benefit eligibility determinations are complicated by the myriad statuses now afforded to individuals within this country. While the rights of lawful permanent residents, refugees, and asylees have been spelled out in immigration and benefit laws, the Executive Branch, Congress, and the courts have created various other statuses that may or may not denote benefit eligibility. The INA should specify categories of aliens by their work and benefit eligibility, such as: those eligible for work and needs-tested benefits; those eligible for work and only those benefits that accrue from employment; and those eligible for no benefits except those provided on an emergency basis or for compelling public health, safety, and welfare grounds. Every alien should then be assigned to one of these categories.

Let me add a word here about the Commission's recommendations regarding the eligibility of illegal aliens for public benefits. If an alien is in the U.S. unlawfully, he or she should not receive publicly-funded aid except in very unusual circumstances: where there is emergent need for specific assistance, such as emergency health care; where there is a public health, safety or welfare interest (such as immunizations, programs to prevent the spread of communicable diseases, child nutrition programs and school lunch programs); and where their eligibility is constitutionally protected.

Why this distinction between the eligibility of legal immigrants and illegal aliens? Illegal aliens have no right to be in this country. They are not part of our social community. There is no intention that they integrate. As human beings, they have certain rights-we certainly should not turn them away in a medical emergency. As a nation, it is in our interest to provide a limited range of other services- immmunizations and treatment of communicable diseases certainly fall into that category. But, if illegal aliens require other aid, it should rightly be provided in their own countries.

One last observation. We have heard arguments that the safety net should be for citizens only, that we cannot afford to do more.

I believe firmly that citizenship in this country is something to be cherished and protected. I want all immigrants to become citizens. I want them to seek citizenship because it is the key to full participation in our political community-to know first hand and understand the American form of democracy. I want unnecessary barriers to naturalization-and there are many of them-to be removed. However, I do not want immigrants to seek citizenship because it is the only route to our safety nets. To me, that would be a debasement of our notions of citizenship.

From my perspective, the safety net provided by welfare programs should be for those members of our social

community who are most in need. It would be far better if no one needed welfare. In deciding who should receive this help, I, for one, do not want to protect some Americans at the expense of others. That course of action is not consistent with the principles of equal protection under the law. Nor does it help us achieve that all too elusive goal-a united country.

I would be happy to answer any questions you may have.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan
Chair, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on the Judiciary
Subcommittee on International Law, Immigration and Refugees
September 29, 1994

Mr. Chairman, members of the Subcommittee, thank you for providing this opportunity to testify today about the Commission's recommendations to deter the employment of unauthorized workers. As the members of this Committee know, the Commission was established under the Immigration Act of 1990 and mandated to report to Congress on the implementation and impact of U.S. immigration policy. We will submit our first report tomorrow. I welcome the opportunity to return to this room to testify on the full range of recommendations included in the report. For today, I will limit my remarks to the Commission's recommendations on worksite issues.

But before getting into our specific recommendations in this area, let me set them in context. The Commission is convinced that immigration can be managed more effectively. We also believe we can do it in a manner that is consistent with our traditions, civil rights, and civil liberties. As a nation committed to immigration and the rule of law, it is our obligation to find solutions to our current immigration problems. And, the principal problem we face today regarding immigration is the unauthorized entry of hundreds of thousands of illegal aliens each year.

Unlawful immigration will not be curbed unless we have comprehensive strategies that will prevent the entry of those with no right to be here and remove those who somehow make it past our best efforts at border management. At the same time, we must better support our capacity to facilitate the legal entry of those whose admission is in our national interest.

Key to effective deterrence is a reduction in the job magnet. Employment continues to be the principal reason illegal aliens come to this country. As long as U.S. businesses benefit from the hiring of unauthorized workers, control of unlawful immigration will be impossible. The Commission believes that both employer sanctions and enhanced labor standards enforcement are essential components of a strategy to reduce employment opportunities for illegal aliens.

The Commission has found major flaws in the current application of employer sanctions. They have not deterred unlawful immigration, but they have caused discrimination. At each of our hearings, we heard about how easy it is to thwart the intent of the law. For $25, any illegal alien can purchase a counterfeit drivers license and social security card. For a bit more, they can buy a counterfeit green card. With these documents, they can get a job in almost any business in this country. At the same time, there is discrimination against foreign-looking or -sounding citizens and legal immigrants. Employers are confused by the requirements and feel themselves between the proverbial rock and a hard place: if they accept documents on their face, they may be hiring illegal aliens; if they ask for additional documentation without sufficient cause, they will be discriminating.

But, are these problems inherent to employer sanctions? We think not. The problem is with a faulty verification procedure.

The Commission's recommendations to improve the verification procedure have drawn more attention than any others in our report. Unfortunately, they have also been misrepresented as a national ID card. What the Commission has recommended is a measured approach to the development of a new system for verifying that individuals are authorized to work in the United States-that is all. We believe the most promising option for alleviating the fraud and discrimination found in current verification procedures is a computerized registry based on the social security number. We urge the President carefully to phase in and evaluate pilot programs to test this option, something that can be done under current statutory authority. This Commission, along with others, will carefully monitor the pilots during the next

three years to see how they meet our requirements for reliability, cost-effectiveness, and protection of civil rights and civil liberties. Should the results prove to be as promising as we hope and expect, we recommend that they form the basis for implementation of a national verification system.

Before I go into any details about this recommendation, let me say something to those who have already expressed concerns about this approach. This country has a problem. It is real. It is immediate. Simply put, if we cannot demagnetize our economy for illegal aliens who come here to seek jobs, we cannot control illegal immigration. If we cannot control illegal immigration, we cannot sustain our national interest in legal immigration. Those who come here illegally, and those who hire them, will destroy the credibility of our immigration policies and their implementation. In the course of that, I fear, they will destroy our commitment to immigration itself.

For immigration to continue to serve our national interest, it must be lawful. There are people who argue that some illegal aliens contribute to our community because they may work, pay taxes, send their children to our schools, and in all respects except one, obey the law. Let me be clear: that is not enough.

This is a nation governed by the rule of law. It applies to all. It is as illegal knowingly to hire someone who is breaking the law as it is illegal to work under false pretences. These recommendations are not just for the four million illegal aliens in our midst-an arguably small number given the size of the U.S. workforce. They are aimed, as well, at restoring credibility to our overall immigration policy, commitment to fair labor standards, respect for civil and human rights, and integrity of our social security system.

Some of those who agree with our assessment as to the weaknesses in employer sanctions reject our proposal for change in the verification system. Some call instead for the repeal of employer sanctions. This is the critical issue. If employer sanctions are repealed, it will be legal for employers knowingly to hire those who are breaking the law. This will seriously undermine efforts to prevent illegal migration. It will seriously erode labor standards. Thousands of Americans will be subject to discimination, exploitation, and denial of their rights. The Commission has considered and rejected this option.

Others call for more modest change-reduction in the number of documents used, requirements that all citizens present one set of documents and all aliens present another, and similar proposals. These ideas are variations on the current I-9 process. But the I-9 process does not do what the law intended-deter the employment of illegal aliens. And what it does do, we do not want-overburden businesses with paperwork and provide a convenient excuse, if not actually motivate, discrimination against Americans who happen to look or sound foreign. The Commission examined these and dozens of other options for reforming the I-9 process and rejected them as well. Under each of them, either fraud continued or discrimination increased.

If repeal of employer sanctions is not an option, and if reform of the I-9 does not appear workable, what then are we to do?

In a nutshell, the Commission believes that we can best address the twin flaws in employer sanctions by treating everyone the same, whether citizen or alien. Illegal aliens cannot hide from the law by claiming to be authorized workers; citizens will not face discrimination from those who mistakenly believe them to be illegal aliens. The key to what the Commission sees as the promising option is the social security number. All workers must already provide a social security number upon taking employment. The verification process that the Commission is looking at adds a step to this existing requirement: checking that the social security number is valid and has been issued to someone authorized to work in the United States.

The Commission urges the President immediately to initiate pilot programs testing the proposed computerized verification system. We would like to see the system tested in the five states with the highest levels of illegal immigration as well as in some less affected places. The pilots will permit testing of various approaches to using the proposed verification system. In particular, the pilots should determine the best way for employers to access the verification system to validate the accuracy of information given by workers. We have received conflicting testimony about the best way to check the applicant's identity. We have heard proposals for a more secure social security card, a counterfeit-resistant driver's license, and a telephone verification system that does not rely on any document. Several different options could be tested simultaneously in different states. The pilots present an opportunity to determine the

most cost-effective, fraud-resistant, and nondiscriminatory method available.

Experts note that under any of these systems, the computer system could have a built-in process for identifying likely fraud. For example, if the same social security number was used too often or in too many locations, the computer system would record the incidence. The employer would be informed that the employee must reconfirm the information in the database. The authorized worker would benefit from learning that others were using his or her social security number. The unauthorized worker could not reconfirm the information and, therefore, would not be able to continue in that employment. The process also would permit estimates of likely fraud for use in determining the efficacy of the verification system.

In designing our recommendation, the Commission considered six principal issues.

The first issue is fraud. We must reduce not only the presence of counterfeit documents, but also the incentive to produce them. The Commission's proposal is to test a system that does not depend on any particular document-indeed, which may not depend on any document at all. All documents can be counterfeited. But it is infinitely more difficult to counterfeit the information that would be in the computer registry. An employee might show a counterfeit drivers license with a fraudulent social security number, but if that number does not exist or belongs to someone else, the computer registry is the most promising way to identify it.

The second is discrimination. As I mentioned, the best way to fight discrimination is to treat everyone exactly the same. Employers would no longer be required to care about a worker's immigration status. The only relevant question would be-"What is your name and social security number?"-a question every American employee has been asked for decades. There would be no singling out of any ethnic group for additional documentation, as happens now with the I-9 process, no going to one database if the employee is an alien-as happens under the current INS Telephone Verification pilot program-and another system if he or she is a citizen. No bigot will be able to claim employer sanctions as an excuse for discrimination.

The third is privacy. The Commission is aware of the proliferation of databases and the potential for the invasion of privacy by both government and private agencies. The computer registry will be drawn primarily from an existing database, the Social Security computer system. Given the scope of the registry, it is essential to build in explicit provisions for protecting privacy. These safeguards should be made by law, not just regulation. The resultant computer system should incorporate appropriate technical safeguards regarding authorized users' access to individual information. In particular, safeguards must ensure that information about specific individuals-other than the limited information to be provided as a part of the verification process itself-cannot be obtained from the database.

The fourth is civil liberties. Since previewing our recommendations in August, we have heard concerns that the computer registry will result in an infringement on personal liberties. The Commission takes this very seriously indeed. We recommend that appropriate, ironclad safeguards be built into the system from Day One to ensure that the verification system will be used for very limited purposes and those purposes alone-to verify work authorization and eligibility for public benefits. We also have heard concerns that some day in the future the registry will be perverted for other purposes. Let me say that I have more faith in the American political process. I expect and sincerely hope that all institutions concerned with preserving the Constitution will monitor closely the implementation not only of the pilot programs, but of any national system that may result from them. If they demonstrate that fears about civil liberties have been realized, I will be the first to testify before this body for the repeal of the verification process. And, if I am no longer here, I have every faith that others will take up the banner.

The fifth is the accuracy of the information used. The computerized registry will draw on data from the INS and the Social Security Administration. A prime prerequisite of this system is the integrity of those data systems. Of course for reasons completely separate from this registry, we would encourage that integrity. Why would we tolerate a situation where a government agency cannot answer basic questions for those it serves? No one paying into the Social Security System should need worry whether someone else is fraudulently using his or her number. No immigrant should suffer because INS cannot find his or her file.

Both agencies will need to improve their own records, speed up the entry of new data into their own systems and the transfer of the necessary information to the jointly maintained registry, and ensure that the information remains accurate

and accessible. The Commission recognizes that mistakes will happen, particularly during the early phase-in period of the pilot programs. We must have protections for workers who might otherwise lose jobs because of "false negatives" and for employers who might hire illegal aliens because of "false positives."

The sixth is cost. Informal estimates by the Social Security Administration indicate that this proposal is no budget breaker. The cost of design and development of the combined SSA/INS database is estimated at $4 million over a two-year period. Annual cost of maintaining and operating the verification system is estimated at about $32 million. This figure includes the cost of the computer registry, the automated system for checking social security numbers against it, operator costs for calls that cannot be handled automatically, and telephone lines for an 800-number to be used by employers.

Correcting errors will require the largest financial input. Discrepancies referred to SSA for resolution will cost approximately $122 million initially, with an ongoing cost of $30 million. The cost of resolving discrepencies in the INS database will be additional to these funds. For the most part, these funds should be spent even if there were no proposal for a computer registry. Otherwise, we would be saying that it is all right to have discrepencies in our Social Security and INS databases. For the integrity of both of these systems, we need to ensure that the data they already collect are accurate and accessible.

You asked me here today to testify about the Commission's recommendation on verification, but I would be remiss if I did not at least briefly address the Commission's other worksite proposals. First, we call for enhancements in the enforcement of labor standards. While we do not believe that labor standards alone will curb illegal immigration, we do strongly support enhanced labor standards enforcement as a necessary complement to employer sanctions. As for employer sanctions themselves, once changes are made in the verification system, higher priority should be given in INS to investigation of the knowing hire of illegal aliens. And, should the pilot programs prove effective, we would hope that this body would make some major changes in employer sanctions penalties to remove the ones for paperwork violations and enhance those for knowing hire and failure to verify a social security number. In our report, we also make recommendations regarding the coordination of labor standards and employer sanctions-recommendations that I won't discuss today but call to your attention.

Before finishing this testimony, l want to say a bit more about the issue of discrimination. As I mentioned, the Commission believes that the best defense against discrimination is adoption of a more secure, simpler verification process for determining work authorization. The current verification process creates discriminatory behavior among employers even in cases where no discrimination is intended or in which there is an explicit effort to avoid illegal conduct.

Even with this change in verification, however, discrimination on national origins and citizenship bases will not disappear. The Commission firmly believes there is a public responsibility to provide effective redress for those who are the victims of unfair employment practices. I hope you will pay as much attention to our recommendations on discrimination as you do to our recommendations on verification itself. The Commission urges the Office of Special Counsel for Immigration-Related Unfair Employment Practices to be far more aggressive than it has been in the past. OSC should be proactive in finding ways to prevent the occurrence of these unfair employment practices, to the extent possible, and seeking penalties against those employers who do discriminate.

I would be pleased to answer any questions that you have.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Lawrence H. Fuchs
Meyer and Walter Jaffe Professor of American Civilization and Politics
Brandeis University
Before the U.S. House of Representatives
Committee on Ways and Means
Subcommittee on Human Resources
January 27, 1995

My name is Lawrence H. Fuchs. I am Meyer and Walter Jaffe Professor of American Civilization and Politics at Brandeis University. I have spent most of my professional life studying the history and policy of immigration. From 1979 to 1981, I was the Executive Director of the Select Commission on Immigration Reform and currently, I am Vice Chair of the U.S. Commission on Immigration Reform.

I believe that there are three basic options with regard to reforming the benefits eligibility system for lawful permanent resident aliens.

The first is to turn the matter over to the states.

The second is for Congress to categorically deny such benefits.

The third, unanimously adopted by the Congressionally-appointed bipartisan Commission on Immigration Reform, is to make the affidavits of sponsors of immigrants enforceable for the period in which sponsor income has been deemed available to immigrants to keep them from becoming public charges.

If you turn the responsibility over to the states with the expectation that each will find its own policy, you may create a serous constitutional problem. A unanimous Supreme Court ruled in Graham v. Richardson in 1971 that any state law that distinguishes between permanent resident aliens and citizens with respect to public assistance is in violation of the Constitution's Fourteenth Amendment equal protection clause. The Court ruled emphatically that it was impermissible for states to make welfare classifications based on legal alienage for fiscal reasons.

Possibly, the Congress can make constitutionally permissible what the states cannot do on their own, although that is not certain.

Whatever the constitutional disposition of such a case might be, it would, in my opinion, be bad policy for either the Congress or the states to make what the Court called an invidious distinction, one which it found to be subject to strict constitutional scrutiny.

Immigrants come to the United States as close relatives of citizens and resident aliens already here and because of their needed skills or other economic assets. If the numbers or categories are wrong, if they are not in our national interest, we should change them. The Commission on Immigration Reform is looking intensely at such questions now. But members of this bipartisan commission, including both strong conservatives and liberals, are unanimous in recommending against categorical distinctions between permanent resident aliens and citizens with regard to benefits under discussion here. To do so would be to cut at the heart of what makes the United States different from any other country in the world.

We correctly expect of legal immigrants that the vast majority of them will work hard, save, and invest in their children. Like citizens, they pay taxes and are subject to compulsory service in the armed forces. Many of them actually volunteer. We expect them to add to our language resources and help us to compete in a global economy. Their children provide us with a highly disproportionate number of valedictorians. And most legal permanent resident aliens are

devoted to ideals of freedom, opportunity, and personal and family responsibility.

Well, some will say, "Let them become citizens." Not so easy! The average wait for an INS interview is now seven to ten months. In San Diego, an immigrant who applies for naturalization will be scheduled for an interview about 270 days later. Once approved, the wait to be naturalized varies greatly: ninety days in New York; more than a year in San Diego.

There are long waiting lists almost everywhere for adults to be admitted to English language classes. In New York, the waiting list is often as long as a year, sometimes two. The Riverside Church runs a lottery each month, and those who don't make it must sign up again for the following month.

About 5 percent of those who take the citizenship exam fail, but may never get that far because they are afraid to take it. That is especially true for older persons, many of whom are English language deficient. Persons over fifty-five can take the test in their native language, but they must have been in the U.S. for at least fifteen years.

In Chicago, we learned of a seventy-one-year-old Polish woman who broke down in sobs when she failed the citizenship test for the second time. For many elders, the humiliation of admitting that they may not remember or that they are suffering some impairment or disability is a huge obstacle to applying for and taking the exam. Do we want to say to this woman, if she should suddenly become disabled, that the public assistance is not for her because she is a legal immigrant? That was the situation of one of the plaintiffs in the Graham v. Richardson case.

Do we want to tell a twelve-year-old orphan that she must live on the streets because, as an immigrant, she does not qualify for the program of foster care and adoption assistance under Title IV of the Social Security Act? She'd be in a real Catch-22; she wouldn't qualify for help because she's a legal immigrant, but she can't naturalize because she is underage.

Do we really want to say to a legal immigrant woman who has been beaten by her husband that she must go to a shelter for battered women and be separated from her children because she is not eligible for AFDC, in whatever form it emerges? There are many instances of battered women, permanent resident aliens, who, with their children, were saved by being on AFDC temporarily, and who now are productive members of society.

Do we want to take SSI benefits away from legal immigrants, say a blind seventy-year-old man who collects no retirement benefits? More than three-fourths of elderly legal immigrants receiving SSI do not receive social security benefits, compared to one-third of elderly native-born recipients. We are not going to say to such persons: "Go back to where you came from."

There are other programs that would not be available to legal permanent residents under some of the legislation contemplated that I think you do not wish to eliminate. For example, you may have seen a story on Wednesday regarding this year's Westinghouse Science Prize winners, a hugely, disproportionate number of whom are immigrants or the children of immigrants. The story featured one brilliant fifteen-year-old who, if he had finished just out of the running, would not be eligible for scholarship held under Title IV of the 1965 Higher Education Act. What a loss to the rest of us!

Just as we should be clear in our policy against any broad, categorical denial of public benefits to legal immigrants, so we should be clear that sponsors are to be held financially responsible for the immigrants they bring to this country during the deeming period.

The Commission on Immigration Reform has made several recommendations as to how to do this and is now working on refining them. Benefit eligibility is complicated by the many legal statuses afforded to individuals within this country. Thus, statutory categories should be specified regarding their eligibility for work and benefits. Such categories must include those not authorized to work and not eligible for the benefits we are discussing here. A bright line should be drawn between illegal immigrants and those we have admitted to participate in our communities and work places as a matter of national public policy.

In summary, I hope you will not rush into legislation you will almost certainly regret-legislation that could amount to a

wounding, not just of immigrants, but also of their families, communities, and this beautiful nation of ours.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan,
Chair, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on the Judiciary
Subcommittee on Immigration and Claims
February 24, 1995

Mr. Chairman, members of the Subcommittee, let me express my gratitude to you for the opportunity to report to you on the progress of the work of the bipartisan Commission on Immigration Reform.

In our First Interim Report to Congress, U.S. Immigration Policy: Restoring Credibility, presented to Congress September 30, 1994, this Commission undertook to recommend a comprehensive strategy for controlling illegal immigration. The comprehensive approach we outlined has eight parts.

First, we set forth principles. We are a nation of immigrants committed to the rule of law. The Commission believes that legal immigration has strengthened the country and that it continues to do so. We as a Commission denounce the hostility that seems to be developing toward all immigrants.

To make sense about the national interest in immigration, it is necessary to make distinctions between those who obey the law, and those who violate it. Therefore, we disagree, also, with those who label our efforts to control illegal immigration as somehow inherently anti-immigrant. Unlawful immigration is unacceptable.

The second part of our strategy is worksite enforcement. You will hear testimony today about visa overstayers. You will hear that roughly one-half of the nation's illegal alien problem results from visitors who entered legally but who do not leave when their time is up. Let me tell you in three simple words why that is: they get jobs.

We believe that employer sanctions can work, but only with a reliable system for verifying authorization to work. Employers want to obey the law, but they are caught now between a rock and a hard place. The current system is based on documents. An employer must either accept those documents, knowing that they might be forged, and thus live with the vulnerability to employer sanctions for hiring someone presenting false identification. Or, an employer may choose to ask particular workers for more documentation, which is discrimination.

The Commission has recommended a test of what we regard as the most promising option: electronic validation using a computerized registry based on the social security number. This is the only approach to deterring illegal immigration that does not ignore the half of the problem, the visa overstayer problem you are investigating today. We are pleased with the prompt, bipartisan support that this highly visible recommendation has received, and we look forward to real results from pilot projects before our final report in 1997.

Third in our recommmendations for a comprehensive strategy is making eligibility for public benefits consistent with our immigration policy. Decisions about eligibility should support our immigration objectives. Accordingly, the Commission recommended against eligibility for illegal aliens except in most unusual circumstances.

For legal immigrants, we recommended making abuse of the public charge provision grounds for deportation. The affidavit of support that sponsors sign should be a legally-binding contract. Moral obligations work well enough in church, but the law requires a contract.

But the Commission also recommended that legal permanent residents should continue to be eligible for means-tested programs and against any broad, categorical denial of eligibility for public benefits based on alienage for those who obey our laws. It is important to see a lack of citizenship as something more than "the funding mechanism" for welfare

reform. It gets to a fundamental issue for defining the national interest in legal immigration-the relationship between the decision to come here as an immigrant and the decision to naturalize to become a citizen.

Citizenship and naturalization should be more central to the process of immigration. There are many barriers to naturalizing in law and practice, and they should be removed. But it is a debasement of the concept of citizenship to make it the route to welfare.

We on the Commission believe strongly that it is in the national interest for immigrants to become citizens for the right reasons, not the wrong ones. We want immigrants to be motivated to naturalize in order to vote, to be fully participating members of our polity-to become Americans. We don't want to motivate lawabiding aliens to naturalize just so that they can get food stamps, health care, job training, or their homes tested for lead.

Fourth, deportation is crucial. Credibility in immigration policy can be summed up in one sentence: those who should get in, get in; those who should be kept out, are kept out; and those who should not be here will be required to leave. The top priorities for detention and removal, of course, are criminal aliens. But for the system to be credible, people actually have to be deported at the end of the process. The Commission will have additional recommendations on this crucial matter later this year.

Fifth, emergency management. Migration emergencies such as we have seen recently with Haiti and Cuba do recur, and we must be prepared for them. Again, we will have detailed recommendations on migration emergencies.

Sixth, reliable data. The current debate over the economic impact of immigration is marked by shaky statistics, flawed assumptions, and an amazing range of contradictory conclusions from what ought to be commonly-accepted methods. Rather than attempt to choose sides in this discussion, the Commission has contracted with the National Academy of Sciences to analyze the methods used for evaluating immigration data, to cut through this fog. We will share their interim results with you as we receive them.

Seventh, much as we support enhanced enforcement by this country, we must face the fact that unilateral action on the part of the United States will never be enough to curb illegal immigration. Immigrants come here illegally from source countries where conditions prevail that encourage or even compel them to leave. Attacking the root causes of illegal migration is essential and will require international cooperation.

As a case in point, this Commission is the lead agency for the U.S. government in developing the U.S-Mexico Binational Study to analyze the causes of migration across our border with Mexico. Perhaps we can even come to some agreement, not only on the analysis, but also on the policy prescriptions necessary.

Finally, the Commission recommends better border management. Far more can and should be done to meet the twin goals of border management: deterring illegal crossings while facilitating legal ones. But we have to recognize both goals.

The Commission on Immigration Reform endorsed a border crossing fee in principle as a user fee. It should not go into the general treasury. It should be used to avoid the kind of counterproductive backups which happen all the time in border towns. Many people who are authorized to cross the border legally simply tire of waiting in line and cross illegally to save time. This is a waste of resources for the Border Patrol, which frequently apprehends such people. We applaud the efforts of innovative Border Patrol leaders, such as Silvestre Reyes with Operation Hold the Line in El Paso, and we must do our part, as well.

A border crossing fee, properly applied, would benefit the border towns immensely. It would be a kind of NAFTA fund, used along both borders, to ensure that legal crossings are convenient and secure. It is to fund the future prosperity of border towns like El Paso, Laredo, Nogales, and San Diego that depend so much on crossborder trade.

So that is our eight-point strategy for dealing with illegal immigration in a comprehensive, systematic way. The Commission made all of these recommendations unanimously, by consensus. We are nine Commissioners, Republicans and Democrats, a diverse group. We might have been expected to simply throw up our hands at the difficulty of the task Congress mandated for us. But we put aside rhetoric. We determined that we would look for answers-and not excuses.

And our work is not done.

I must leave here shortly, Mr. Chairman, to return to my colleagues just around the corner here, who are engaged in the second day of consultations on legal immigration reform. The Commission is well along in its consideration of the national interest in legal immigration, of the qualities that we seek in immigrants, of the limits. Our first report represented a hard-won, bipartisan consensus on emotionally-tough, intellectually-complex issues.

We ask that you give us the chance to try to reach such a bipartisan consensus on legal immigration reform. Bipartisanship ought to be more common. There is a time and a place for partisan battles, to be sure. But immigration, like foreign policy, ought to be a place where the national interest comes first, last, and always.

Immigration is far too important to who we are as a nation to become a wedge issue in Presidential politics. We have seen that kind of thing happen before, and it is not productive. I, for one, wish that we would do away with all the hyphenation and just be Americans, together.

I will be glad to answer any questions you may have.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Robert Charles Hill
Commissioner, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on the Judiciary
Subcommittee on Immigration and Claims
March 3, 1995

Mr. Chairman and Members of the Subcommittee, on behalf of Professor Barbara Jordan, our Chair, and my fellow members of the U.S. Commission on Immigration Reform, I want to thank you for this opportunity to testify. This bipartisan Commission recognizes and deeply appreciates the support that we have received from Congress and this Subcommittee in particular.

In our first report to Congress last fall, U.S. Immigration Policy: Restoring Credibility, we sought to recommend a comprehensive strategy. We chose to focus much of that report on measures to control illegal immigration because growing frustration about it undermines our first commitment to legal immigration in the national interest.

Worksite enforcement, the subject of today's hearing, is particularly important to restoring the credibility of our commitment to the national interest in immigration. The Commission's recommendations for reducing the pull of the employment magnet are crucial to success in deterring illegal immigration.

The Commission's recommendations in this critical area fall into two categories: one, developing and implementing a better system to verify work authorization at the worksite; two, the need to couple worksite verification with enhanced enforcement of wage and hour and other labor standards, including provisions to protect workers from discrimination.

Let me sum up the Commission's reasons for proposing that we develop a better system for worksite verification. Reducing the employment magnet is the linchpin of a comprehensive strategy to reduce illegal immigration. Illegal aliens are here for jobs. That is the attraction. So the only effective way to deter illegal immigration must include the worksite.

Better border enforcement is necessary, but not sufficient. You heard testimony last Friday that visa overstayers make up fully one-half of the influx of illegal aliens, 150,000 out of 300,000 who take up permanent residence here illegally every year, on top of an illegal population that exceeds 4 million already. No amount of border enforcement can solve that half of the problem-the people who enter legally and then do not leave when they should.

We simply must develop a better system for verifying work authorization. That is central to effective enforcement of employer sanctions.

The system we have now, the I-9 process, is doubly-flawed. It does not do what it was supposed to do, namely deter the employment of illegal aliens. What it does do, we do not want-namely, burden businesses with paperwork, while creating abundant opportunities for fraud and forgeries. It may even provide an excuse for, if it does not actually provoke, discrimination against workers who happen to look or sound foreign.

Honest employers are caught between the proverbial rock and a hard place. Because the system is based on documents, employers are placed in a position of making judgments many do not feel qualified to make.

Identifying forgeries is difficult, even for trained professionals. If an employer accepts false documents presented by an unauthorized worker, that employer is vulnerable to employer sanctions for having hired someone under false pretences, regardless of the fact that they may well have been fooled themselves. Yet, if an employer chooses to doubt particular documents and asks for more from some workers and not from others, that is discrimination.

The Commission believes that we must develop a better system of worksite verification and that the way to do it is immediately to test the most promising option. After examining a wide range of alternatives, the Commission concluded that the most promising option for secure, nondiscriminatory verification is a computerized registry based on the social security number.

For decades, all workers have been required to provide employers with their social security number. Depending on the results of pilot projects that are now being designed, the cumbersome I-9 process, with its dozens of documents and blizzard of paper, could be replaced by a single electronic step to validate information every worker must already provide.

The Commission examined the Telephone Verification System, called TVS, which the INS has been testing. We are aware that the INS will expand this system, first from 9 to 200 sites, and eventually to 1,000 sites. We support this INS effort-but only as an interim measure. It is not the solution.

The fatal flaw in the TVS system is that it ultimately depends on self-attestation. Workers are asked whether they are citizens or aliens. It is simply not sound law enforcement to rely on lawbreakers to tell the truth.

The Commission also looked at the feasibility and effectiveness of reducing the number of documents used in verification. Again, we support such efforts as interim measures. But the fatal flaw here is the vulnerability of all documents to counterfeiting. We heard expert testimony that any document, even the most tamper-proof ones, can be forged so well that only experts can identify the fakes. Employers cannot be expected to identify counterfeit documents.

The Commission believes electronic validation of the social security number is the most promising option because it holds great potential for accomplishing the following:

- **Reduction in the potential for fraud.** Using a computerized registry, rather than relying on documents, guards against counterfeits;
- **Reduction in the potential for discrimination.** All workers must present the same information to be validated;
- **Reduction in the time, resources, and paperwork spent by employers in complying with IRCA.** INS employees who now chase paper could be redirected to chase down those who knowingly hire illegal workers.

The Commission did not try to micromanage the Executive branch's implementation of this recommendation in advance. We deliberately did not spell out precisely how the software of the registry would be designed, although we did specify that just six pieces of information seem necessary: name; social security number; place and date of birth; mother's maiden name; and status code. Nor did we limit the innovation that might be applied in pilot projects to test the registry. But we did speak to some of the most important aspects.

First, hunt where the ducks are. The Commission recommends that pilot projects be undertaken in the five high-impact states-California, Texas, Florida, New York, and Illinois-because that is where the bulk of the illegal alien problem is. We also recommend that, in time, the pilots should be extended to several less-affected states. But we did not recommend that the registry be tested throughout all of the five states immediately, nor even in all of any one of the states. Pilot projects should start small. Before going to the next phase, we should have results to guide us.

Second, there must be objective, systematic evaluation of the pilot programs. This Commission expects to have meaningful results from the initial phase of pilot testing by 1997. We will incorporate these results in our final report to Congress, so that we can make an informed recommendation on whether that system should be implemented nationwide, with particular attention to civil liberties and privacy concerns. The features of pilot programs should include:

- **A means by which employers will access the verification system to validate the accuracy of information given by workers.** We received conflicting testimony about the best way to ascertain that a new hire is who he or she claims to be. Some believe that the tamper-resistant driver's licenses now being issued by many states can do the job; others strongly advocate testing a more secure social security card.

But it is also possible that electronic validation through a telephone system would require no document at all. Every ATM system uses a PIN number to protect our money. We should test to see if personal information, such as the mother's maiden name and date of birth, that is already part of the social security database, can serve the same function for worksite verification.

- **Measures to ensure the accuracy of the necessary data.** Improvements must be made in both the INS and Social Security Administration databases to ensure that employers have timely and reliable access to what they need. Frankly, no one can be opposed to improving the reliability of the data in these agencies. There is no protection of liberty in government error.

- **Measures to ensure against discrimination.** One key to the Commission's recommendation is that employers would no longer have to ascertain whether a worker is a citizen or an alien, native-born or an immigrant. All workers would have to present the same information to be validated.

- **Measures to protect civil liberties.** Explicit protections should be devised to ensure that the registry is used only for its intended purposes. The Commission believes that electronically validating the social security number could be used to ascertain eligibility for public benefits, without damage to civil liberties, because everyone receiving public assistance must already present a social security number, just as they do for work. But the registry is not to be used for routine identification purposes, and there must be penalties for inappropriate use of the verification process. The Commission's unanimous, unequivocal view is that no one should be required to carry a document and produce it on demand to prove their right to be here.

- **Measures to protect privacy.** Explicit provisions also must be built into the system to safeguard individual privacy. The information contained in the registry will be minimal, given its limited purpose. But the Commission is aware that while access to any one piece of information may not be intrusive, in combination with other information it can lead to privacy violations.

- **Estimates of the start-up time and financial and other costs.** The Social Security Administration made preliminary estimates for the Commission of its cost for pilot projects: $4 million over the first two years for design and development; and annual costs of maintenance and operation of $32 million. Discrepancies referred to the Social Security Administration were estimated to cost $122 million initially and $30 million per year thereafter. So the total cost of the registry over five years, according to the Social Security Administration, would be approximately $300 million.

  By way of comparison, the Urban Institute estimates that illegal aliens cost seven states more than $2.1 billion a year. Spending $300 million over five years to save $2 billion each year is a sound investment.

  But the INS cost must be added to the SSA estimate. The Clinton Administration's latest budget request calls for $28.3 million for verification system pilots, although this also includes the expanded TVS program. The bulk of the INS cost, however, will be cleaning up their own data, which should be done regardless of the pilot projects to improve worksite verification.

- **Specification of the rights, responsibilities, and impact on individual workers and employers.** In particular, the Commission recommendation for false negatives is that no one-no one-should be fired if their employer does not get a validation code from the registry after hiring. It is entirely possible that a new hire has merely given their social security number wrong. There is no one who has a greater incentive to correct errors, whether they are at the INS or the Social Security Administration, than a legitimate worker who has just learned from the registry that there is a problem. Speaking as someone who pays into the social security system, I want to be sure that the number I have been using is correct-and has not been misappropriated by an illegal alien.
- **A plan for phasing in the system.** Pilot projects should test various methods for phasing in improvements in worksite verification, according to the test results.

Evaluating the results of pilot programs with these criteria must include objective measures and procedures to determine whether current problems related to fraud, discrimination, and excessive paperwork requirements for employers are effectively overcome, without imposing undue costs on the government, employers, or employees. The evaluation

should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy.

The Commission also recommends reducing the fraudulent access to so-called "breeder documents," particularly birth certificates, that can be used to establish an identity in this country. We recommend these steps:

- Standardized application form for birth certificates;
- Interstate and intrastate matching of birth and death records;
- Only certified copies of birth certificates issued by states should be accepted by federal agencies;

- Standard design and paperstock for all certified copies of birth certificates to reduce counterfeiting;
- Encouraging states to computerize birth records depositories.

The Commission also recommends imposition of greater penalties on those producing or selling fraudulent documents. RICO provisions to facilitate racketeering investigations also should cover conspiracy to produce and sell fraudulent documents.

Let me also summarize the Commission's recommendations regarding labor standards and discrimination. Vigorous enforcement of labor standards and enforcement against knowing hire of unauthorized workers are an integral part of the strategy to reduce illegal immigration. Labor standards and employer sanctions should be seen as mutually enforcing.

The Commission believes that enforcement of employer sanctions, wage/hour, child labor, and other labor standards can be an effective tool in reducing employment of unauthorized workers. But we found that current enforcement efforts are inadequate.

The Commission specifically recommends:

- Increased staff and resources for the enforcement of labor standards to complement employer sanctions enforcement.
- Vigorous enforcement, increased staff and resources, and full use of current penalties against those who knowingly hire unauthorized workers. We believe that the new verification system we have recommended can reduce substantially the inadvertent hiring of unauthorized workers. If the pilot programs bear this out, Congress should discontinue penalties for paperwork violations and evaluate the need for increased penalties against violators and businesses that knowingly hire or fail to verify work authorization for all employees.
- Targetting of investigations to industries that have a history of using illegal alien labor.
- Enhanced enforcement efforts targeted at farm labor and other contractors.
- Application of employer sanctions to the Federal government. Recently the Congress, to its credit, voted to apply to itself the laws that it applies to the nation. At a minimum, the President should issue an Executive Order requiring federal agencies to abide by the procedures required of other employers.

We are particularly concerned that the current level of coordination between the INS and the Department of Labor is insufficient. The Commission has urged the Attorney General and the Secretary of Labor to review the current division of responsibilities between the Departments of Justice and Labor in the enforcement of employer sanctions and labor standards.

Enhanced coordination to promote cooperation among all of the agencies responsible for worksite enforcement is critical. Strategies to promote coordination at both the headquarters and field operations level would include:

- Establishment of a taskforce in Washington, DC to review and set policy;
- Local taskforces of worksite investigators to coordinate field operations; and
- Continued joint training for worksite investigators from all applicable agencies.

Enhanced employer sanctions and labor standards enforcement should be coordinated with improvements regarding enforcment of antidiscrimination provisions. The Commission believes that an improved verification process is the best defense against discrimination. Nevertheless, some improvements can be made in the interim, to reduce immigration-

related discrimination.

The Commission recommends that the Office of Special Counsel initiate more proactive strategies to identify and combat immigration-related discrimination at the worksite. OSC should target resources on independent investigations and on programs to assess the incidence and prevalence of unfair employment practices related to immigration.

Finally, there must be an education component. Thousands of new businesses begin operation each year; many more new workers enter the labor force annually. The Commission recommends that the educational efforts of the responsible federal agencies be coordinated, and continued. The INS and the Department of Labor must communicate a single message to all employers and employees. The Commission also recommends the development of new strategies, including the enhanced use of technology, to inform employers and workers of their rights and responsibilities under the law.

Those are the Commission's recommendations on worksite enforcement. They are a part of the comprehensive approach to immigration reform that this Commission is developing. As you know, the Commission is well along in the next phase of its task, considering the national interest in legal immigration, including categories, priorities, and limits.

The key to our work so far has been that, through intense discussions, we have managed to arrive at a bipartisan consensus. We hope to continue that record in a systematic evaluation of what our immigration policy should be in the twenty-first century. In that effort, we have appreciated this Subcommittee's support and consideration of our work.

I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Robert Charles Hill
Commissioner, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on Government Reform and Oversight
Subcommittee on Government Management, Information and Technology
March 7, 1995

Mr. Chairman and Members of the Subcommittee, on behalf of Professor Barbara Jordan, our Chair, and my fellow members of the U.S. Commission on Immigration Reform, I want to thank you for this opportunity to testify.

In our first report to Congress last fall, *U.S. Immigration Policy: Restoring Credibility*, we sought to recommend a comprehensive strategy to control illegal immigration. Growing frustration about it undermines our first commitment to legal immigration in the national interest.

We simply must develop a better system for verifying work authorization. Reducing the employment magnet is the linchpin of a comprehensive strategy to reduce illegal immigration. Illegal aliens are here for jobs. That is the attraction. So the only effective way to deter illegal immigration must include the worksite. The reliability of government information is critical to this effort.

The system we have now, the I-9 process, is doubly-flawed. It does not do what it was supposed to do, namely deter the employment of illegal aliens. What it does do, we do not want-namely, burden businesses with paperwork, while creating abundant opportunities for fraud and forgeries. It may even provide an excuse for, if it does not actually provoke, discrimination against workers who happen to look or sound foreign.

At the root of these problems is the proliferation of counterfeit documents. During our investigations, the Commission learned that illegal aliens can now purchase counterfeit driver's licenses and social security cards for $25. A green card is slightly more expensive. Moreover, we also learned that counterfeits of any document-even the most tamper-resistant-would soon be on the black market. These cards could easily pass a visual check, particularly by employers who are not trained to spot counterfeits.

Honest employers are caught between the proverbial rock and a hard place. Because the system is based on documents, employers are placed in a position of making judgments many do not feel qualified to make.

Identifying forgeries is difficult, even for trained professionals. If an employer accepts false documents presented by an unauthorized worker, that employer is vulnerable to employer sanctions for having hired someone under false pretenses, regardless of the fact that they may well have been fooled themselves. Yet, if an employer chooses to doubt particular documents and asks for more from some workers and not from others, that is discrimination.

The Commission believes that the way to develop a better system of worksite verification is immediately to test the most promising option. After examining a wide range of alternatives, the Commission concluded that the most promising option for secure, nondiscriminatory verification is a computerized registry based on the social security number.

For decades, all workers have been required to provide employers with their social security number. Depending on the results of pilot projects that are now being designed, the cumbersome I-9 process, with its dozens of documents and blizzard of paper, could be replaced by a single electronic step to validate information every worker must already provide.

The Commission also looked at the feasibility and effectiveness of reducing the number of documents used in

verification. Again, we support such efforts as interim measures. But the fatal flaw here is the vulnerability of all documents to counterfeiting. We heard expert testimony that any document, even the most tamper-proof ones, can be forged so well that only experts can identify the fakes. Employers cannot be expected to identify counterfeit documents.

The Commission believes electronic validation of the Social Security Number is the most promising option because it holds great potential for accomplishing the following:

- **Reduction in the potential for fraud.** Using a computerized registry, rather than relying on documents, guards against counterfeits;
- **Reduction in the potential for discrimination.** All workers must present the same information to be validated;
- **Reduction in the time, resources and paperwork spent by employers in complying with IRCA.** INS employees who now chase paper could be redirected to chase down those who knowingly hire illegal workers.

The Commission did not try to micromanage the Executive branch's implementation of this recommendation in advance. We deliberately did not spell out precisely how the software of the registry would be designed, although we did specify that just six pieces of information seem necessary: name; social security number; place and date of birth; mother's maiden name; and status code. Nor did we limit the innovation that might be applied in pilot projects to test the registry.

There must be objective, systematic evaluation of the pilot programs. This Commission expects to have meaningful results from the initial phase of pilot testing by 1997. We will incorporate these results in our final report to Congress, so that we can make an informed recommendation on whether that system should be implemented nationwide, with particular attention to civil liberties and privacy concerns. The features of pilot programs should include:

- **A means by which employers will access the verification system to validate the accuracy of information given by workers.** We received conflicting testimony about the best way to ascertain that a new hire is who he or she claims to be. Some believe that the tamper-resistant driver's licenses now being issued by many states can do the job; others strongly advocate testing a more secure social security card.

  But it is also possible that electronic validation through a telephone system would require no document at all. Every ATM system uses a PIN number to protect our money. We should test to see if personal information, such as the mother's maiden name and date of birth, that is already part of the social security database, can serve the same function for worksite verification.

- **Measures to ensure the accuracy of the necessary data.** Improvements must be made in both the INS and Social Security Administration databases to ensure that employers have timely and reliable access to what they need. Frankly, no one can be opposed to improving the reliability of the data in these agencies. There is no protection of liberty in government error.

- **Measures to ensure against discrimination.** One key to the Commission's recommendation is that employers would no longer have to ascertain whether a worker is a citizen or an alien, native-born or an immigrant. All workers would have to present the same information to be validated.

- **Measures to protect civil liberties.** Explicit protections should be devised to ensure that the registry is used only for its intended purposes. The Commission believes that electronically validating the social security number could be used to ascertain eligibility for public benefits, without damage to civil liberties, because everyone receiving public assistance must already present a social security number, just as they do for work. But the registry is not to be used for routine identification purposes, and there must be penalties for inappropriate use of the verification process. The Commission's unanimous, unequivocal view is that no one should be required to carry a document and produce it on demand to prove their right to be here.

- **Measures to protect privacy.** Explicit provisions also must be built into the system to safeguard individual privacy. The information contained in the registry will be minimal, given its limited purpose. But the Commission is aware that, while access to any one piece of information may not be intrusive, in combination with other information it can lead to privacy violations.

- **Estimates of the start-up time and financial and other costs.** The Social Security Administration made preliminary estimates for the Commission of its cost for pilot projects: $4 million over the first two years for design and development; and annual costs of maintenance and operation of $32 million. Discrepancies referred to the Social Security Administration were estimated to cost $122 million initially and $30 million per year thereafter. So the total cost of the registry over five years, according to the Social Security Administration, would be approximately $300 million.

  By way of comparison, the Urban Institute estimates that illegal aliens cost seven states more than $2.1 billion a year. Spending $300 million over five years to save $2 billion each year is a sound investment.

  But the INS cost must be added to the SSA estimate. The Clinton Administration's latest budget request calls for $28.3 million for verification systems pilots, although this also includes other programs. The bulk of the INS cost, however, will be cleaning up their own data, which should be done regardless of the pilot projects to improve worksite verification.

- **Specification of the rights, responsibilities, and impact on individual workers and employers.** In particular, the Commission recommendation for false negatives is that no one-no one-should be fired if their employer does not get a validation code from the registry after hiring. It is entirely possible that a new hire has merely given their social security number wrong. There is no one who has a greater incentive to correct errors, whether they are at the INS or the Social Security Administration, than a legitimate worker who has just learned from the registry that there is a problem. Speaking as someone who pays into the social security system, I want to be sure that the number I have been using is correct-and has not been misappropriated by an illegal alien.

- **A plan for phasing in the system.** Pilot projects should test various methods for phasing in improvements in worksite verification, according to the test results.

Evaluating the results of pilot programs with these criteria must include objective measures and procedures to determine whether current problems related to fraud, discrimination, and excessive paperwork requirements for employers are effectively overcome, without imposing undue costs on the government, employers, or employees. The evaluation should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy.

While we on the Commission are not the computer experts, and never pretended to be, we do recognize "Garbage In, Garbage Out." Clearly, people who obtain real documents through false pretenses pose a problem. This is true, even though the Social Security Administration does a face-to-face interview and document check on every adult who seeks a social security number, since nowadays most children receive numbers shortly after birth.

Accordingly, the Commission also recommends reducing the fraudulent access to so-called "breeder documents," particularly birth certificates, that can be used to establish an identity in this country. We recommend these steps:

- Standardized application form for birth certificates;
- Interstate and intrastate matching of birth and death records;
- Only certified copies of birth certificates issued by states should be accepted by federal agencies;
- Standard design and paperstock for all certified copies of birth certificates to reduce counterfeiting;
- Encouraging states to computerize birth records depositories.

The Commission also recommends imposition of greater penalties on those producing or selling fraudulent documents. RICO provisions to facilitate racketeering investigations also should cover conspiracy to produce and sell fraudulent documents.

The Commission's recommendations regarding worksite verification are an important part, but only a part, of the comprehensive approach to immigration reform that this Commission is developing. As you know, the Commission is well along in the next phase of its task, considering the national interest in legal immigration, including categories, priorities, and limits.

The key to our work so far has been that, through intense discussions, we have managed to arrive at a bipartisan consensus. We hope to continue that record in a systematic evaluation of what our immigration policy should be in the twenty-first century. In that effort, we appreciate this Subcommittee's consideration of our work.

I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Susan Martin
Executive Director, U.S. Commission on Immigration Reform
U.S. Senate
Committee on the Judiciary
Subcommittee on Immigration and Claims
March 14, 1995

Mr. Chairman and Members of the Subcommittee, on behalf of Professor Barbara Jordan, our Chair, and the members of the U.S. Commission on Immigration Reform, I want to thank you for this opportunity to testify.

In our first report to Congress last fall, U.S. Immigration Policy: Restoring Credibility, the Commission sought to recommend a comprehensive strategy. We chose to focus much of that report on measures to control illegal immigration, because growing frustration about it undermines our first commitment to legal immigration in the national interest.

S.269, introduced by the Majority Leader on behalf of Senator Simpson, tracks the Commission recommendations closely in many areas that are critical to a comprehensive approach-worksite verification, increasing penalties for alien smuggling and document fraud, border management, and bringing eligibility for public assistance into line with the goals of our immigration policy.

The Commissioners deeply appreciate the support which this Subcommittee has provided, on a bipartisan basis, to the Commission. Professor Barbara Jordan, our Chair, not only regretted that she could not be here personally today, she instructed me to offer the Commission's assistance to the Subcommittee in any way we can be helpful as you move forward with this legislation.

Let me sum up the Commission's reasons for proposing that we develop a better system for worksite verification. Reducing the employment magnet is the linchpin of a comprehensive strategy to reduce illegal immigration. Illegal aliens are here for jobs. That is the attraction. So the only effective way to deter illegal immigration must include the worksite.

Better border enforcement is necessary, but not sufficient. Visa overstayers make up fully one-half of the influx of illegal aliens, 150,000 out of 300,000 who take up permanent residence here illegally every year, on top of an illegal population that exceeds 4 million already. No amount of border enforcement can solve that half of the problem-the people who enter legally and then do not leave when they should.

We simply must develop a better system for verifying work authorization. That is central to effective enforcement of employer sanctions.

The system we have now, the I-9 process, is doubly-flawed. It does not do what it was supposed to do, namely deter the employment of illegal aliens. What it does do, we do not want-namely, burden businesses with paperwork, while creating abundant opportunities for fraud and forgeries. It may even provide an excuse for, if it does not actually provoke, discrimination against workers who happen to look or sound foreign.

Honest employers are caught between the proverbial rock and a hard place. Because the system is based on documents, employers are placed in a position of making judgments many do not feel qualified to make.

Identifying forgeries is difficult, even for trained professionals. If an employer accepts false documents presented by an unauthorized worker, that employer is vulnerable to employer sanctions for having hired someone under false pretences, regardless of the fact that they may well have been fooled themselves. Yet, if an employer chooses to doubt particular

documents and asks for more from some workers and not from others, that is discrimination.

The Commission believes that we must develop a better system of worksite verification and that the way to do it is through pilot testing. After examining a wide range of alternatives, the Commission concluded that the most promising option for secure, nondiscriminatory verification is a computerized registry based on the social security number.

For decades, all workers have been required to provide employers with their social security number. Depending on the results of pilot projects that are now being designed, the cumbersome I-9 process, with its dozens of documents and blizzard of paper, could be replaced by a single electronic step to validate information every worker must already provide.

The Commission examined the Telephone Verification System, called TVS, which the INS has been testing. We are aware that the INS will expand this system, first from 9 to 200 sites, and eventually to 1,000 sites. We support this INS effort-but only as an interim measure. It is not the solution.

The fatal flaw in the TVS system is that it ultimately depends on self-attestation. Workers are asked whether they are citizens or aliens. It is simply not sound law enforcement to rely on lawbreakers to tell the truth.

The Commission also looked at the feasibility and effectiveness of reducing the number of documents used in verification. Again, we support such efforts as interim measures. But the fatal flaw here is the vulnerability of all documents to counterfeiting. We heard expert testimony that any document, even the most tamper-proof ones, can be forged so well that only experts can identify the fakes. Employers cannot be expected to identify counterfeit documents.

The Commission believes electronic validation of the social security number is the most promising option because it holds great potential for accomplishing the following:

- **Reduction in the potential for fraud.** Using a computerized registry, rather than relying on documents, guards against counterfeits;
- **Reduction in the potential for discrimination.** All workers must present the same information to be validated;
- **Reduction in the time, resources, and paperwork spent by employers in complying with IRCA.** INS employees who now chase paper could be redirected to chase down those who knowingly hire illegal workers.

The Commission did not try to micromanage implementation of this recommendation in advance. We deliberately did not spell out precisely how the software of the registry would be designed, although we did specify that just six pieces of information seem necessary: name; social security number; place and date of birth; mother's maiden name; and status code. Nor did we limit the innovation that might be applied in pilot projects to test the registry. But we did speak to some of the most important aspects.

First, focus on those areas with the largest numbers of illegal aliens. The Commission recommends that pilot projects be undertaken in the five high-impact states-California, Texas, Florida, New York, and Illinois. We also recommend that, in time, the pilots should be extended to several less-affected states. But we did not recommend that the registry be tested throughout all of the five states immediately, nor even in all of any one of the states. Pilot projects should start small. Before going to the next phase, we should have results to guide us.

Second, there must be objective, systematic evaluation of the pilot programs. We hope that this Committee will add its voice to this recommendation. The Commission expects to have meaningful results from the initial phase of pilot testing by 1997. We will incorporate these results in our final report to Congress, so that we can make an informed recommendation on whether that system should be implemented nationwide, with particular attention to civil liberties and privacy concerns.

The features of pilot programs should include:

- **A means by which employers will access the verification system to validate the accuracy of information given by workers.** We received conflicting testimony about the best way to ascertain that a new hire is who he or she claims to be. Some believe that the tamper-resistant driver's licenses now being issued by many states can do

the job; others strongly advocate testing a more secure social security card.

But it is also possible that electronic validation through a telephone system would require no document at all. Every ATM system uses a PIN number to protect our money. We should test to see if personal information, such as the mother's maiden name and date of birth, that is already part of the social security database, can serve the same function for worksite verification.

- **Measures to ensure the accuracy of the necessary data.** Improvements must be made in both the INS and Social Security Administration databases to ensure that employers have timely and reliable access to what they need. Frankly, no one can be opposed to improving the reliability of the data in these agencies. There is no protection of liberty in government error.

- **Measures to ensure against discrimination.** One key to the Commission's recommendation is that employers would no longer have to ascertain whether a worker is a citizen or an alien, native-born or an immigrant. All workers would have to present the same information to be validated.

- **Measures to protect civil liberties.** Explicit protections should be devised to ensure that the registry is used only for its intended purposes. The Commission believes that electronically validating the social security number could be used to ascertain eligibility for public benefits without damage to civil liberties, because everyone receiving public assistance must already present a social security number, just as they do for work. But the registry is not to be used for routine identification purposes, and there must be penalties for inappropriate use of the verification process. The Commission's unanimous, unequivocal view is that no one should be required to carry a document and produce it on demand to prove their right to be here.

- **Measures to protect privacy.** Explicit provisions must also be built into thesystem to safeguard individual privacy. The information contained in the registry will be minimal, given its limited purpose. But the Commission is aware that, while access to any one piece of information may not be intrusive, in combination with other information it can lead to privacy violations.

- **Estimates of the start-up time and financial and other costs.** The Social Security Administration made preliminary estimates for the Commission of its cost for pilot projects: $4 million over the first two years for design and development; and annual costs of maintenance and operation of $32 million. Discrepancies referred to the Social Security Administration were estimated to cost $122 million initially and $30 million per year thereafter. So the total cost of the registry over five years, according to the Social Security Administration, would be approximately $300 million.

  By way of comparison, the Urban Institute estimates that illegal aliens cost seven states more than $2.1 billion a year. Spending $300 million over five years to save $2 billion each year is a sound investment.

  But the INS cost must be added to the SSA estimate. The Clinton Administration's latest budget request calls for $28.3 million for verification system pilots, although this also includes the expanded TVS program. The bulk of the INS cost, however, will be cleaning up their own data, which should be done regardless of the pilot projects to improve worksite verification.

- **Specification of the rights, responsibilities, and impact on individual workers and employers.** In particular, the Commission recommendation for false negatives is that no one-no one-should be fired if their employer does not get a validation code from the registry after hiring. It is entirely possible that a new hire has merely given their social security number wrong. There is no one who has a greater incentive to correct errors, whether they are at the INS or the Social Security Administration, than a legitimate worker who has just learned from the registry that there is a problem. Speaking as someone who pays into the social security system, I want to be sure that the number I have been using is correct-and has not been misappropriated by an illegal alien.

- **A plan for phasing in the system.** Pilot projects should test various methods for phasing in improvements in worksite verification, according to the test results.

An evaluation of pilot program results with these criteria must include objective measures and procedures to determine whether current problems related to fraud, discrimination, and excessive paperwork requirements for employers are effectively overcome, without imposing undue costs on the government, employers, or employees. The evaluation should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy.

The Commission also recommends reducing the fraudulent access to so-called "breeder documents," particularly birth certificates, that can be used to establish an identity in this country. We recommend these steps:

- A standardized application form for birth certificates;
- Interstate and intrastate matching of birth and death records;
- Only certified copies of birth certificates issued by states should be accepted by federal agencies;
- Standard design and paperstock for all certified copies of birth certificates to reduce counterfeiting;
- Encouraging states to computerize birth records depositories.

The Commission further recommends imposition of greater penalties on those producing or selling fraudulent documents. RICO provisions to facilitate racketeering investigations also should cover conspiracy to produce and sell fraudulent documents.

Those are the Commission's recommendations on worksite verification.

Let me add one more note about worksite enforcement. While improved verification is essential, there are interim steps that can be taken to reduce the magnet that jobs present for illegal aliens. The Commission recommends:

- Enhanced resources for investigation of labor standards violations;
- Greater coordination between the Department of Labor and INS in enforcement of employer sanctions and labor standards;
- More targeted enforcement of employer sanctions on industries with a history of illegal alien labor; and
- More proactive enforcement of antidiscrimination laws.

Together, these and other strategies recommended by the Commission should help make jobs attractive to U.S. workers, while identifying and penalizing employers who knowingly hire illegal aliens.

As you know, the Commission is well along in the next phase of its task, considering the national interest in legal immigration, including categories, priorities, and limits. The key to our work so far has been that, through intense discussions, we have managed to arrive at a bipartisan consensus. We hope to continue that record in a systematic evaluation of what our immigration policy should be in the twenty-first century. In that effort, we have appreciated this Subcommittee's support and consideration of our work.

I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Susan Martin
Executive Director, U.S. Commission on Immigration Reform
Before the U.S. Senate
Committee on Finance
March 27, 1995

On behalf of Professor Barbara Jordan, our Chair, and the Members of the U.S. Commission on Immigration Reform, I want to thank you for the opportunity to testify before you today.

First, let me explain the role of the Commission on Immigration Reform. It is a bipartisan body made up of eight Commissioners appointed by the Congress. Two Commissioners are appointed by the respective leadership of both parties in the House and the Senate, and the Chair is appointed by the President. We are a Congressional Commission. Our mandate from the Congress in the Immigration Act of 1990 charges the Commissioners to make a comprehensive analysis of immigration policy and to make specific recommendations for reform.

In the Commission's first interim report, *U.S. Immigration Policy: Restoring Credibility*, issued last September, the Commission recommended a comprehensive strategy for controlling illegal immigration. The Commission has been gratified that many of these recommendations have been incorporated in Senator Simpson's bill, S. 269, the Immigrant Control and Financial Responsibility Act of 1995. The Commission's recommendations also have received significant support from the Chairman of the House Subcommittee, Lamar Smith, and the Chair of the House Taskforce on Immigration, Elton Gallegly, as well as from the President in the State of the Union address.

The Commission is pleased that this Committee has taken up the SSI issue with respect to immigrants. Immigrants have become an important percentage of SSI recipients, one which is large and growing.

It would appear that the disproportionate use of benefit programs by the foreign-born is confined largely to Supplemental Security Income program for the aged, blind, and disabled. This is not too surprising when one considers eligibility criteria for the main source of income for the elderly, the social security program. Social security requires beneficiaries or the spouses of beneficiaries to have worked for forty quarters, which is ten years. It is much more likely that native-born Americans as compared with immigrants, will meet the work-quarter requirement. Most, though not all, social security recipients would be income ineligible for SSI. By contrast, needy elderly who do not receive social security generally qualify for SSI.

This is even more apparent when examining the utilization rates for foreign-born by period of entry. Older persons who entered in recent time periods are more likely to be receiving public assistance income than are those who entered while still in their working years. Those who were fifty-five years or older at the time of entry are the least likely to qualify for social security even if they work for a period of time after arrival. Only 4.2 percent of foreign-born persons who immigrated in the 1980s received social security income in 1989, compared to 29 percent of the foreign-born persons who entered before 1980.

The foreign-born utilization of SSI is confirmed by administrative data. SSI program data reveal that approximately 25 percent of elderly SSI recipients are foreign-born. Overall, 10.6 percent of SSI recipients are foreign-born. This proportion has risen steeply since 1982, the first year that statistics were available, when 3.3 percent of SSI recipients were foreign-born. The number of aliens receiving aged benefits increased from 92,00 in 1982 to 373,000 in 1992. The number of blind and disabled aliens increased from 92,000 in 1982 to 228,500 in 1992.

The apparent increase in the proportion of immigrants receiving SSI may be due, in part, to the recent arrival of an increasing number of older immigrants. Nearly 12 percent (416,000) of the foreign-born residents who were sixty years or older in 1990 entered during the 1980s. They had not earned sufficient social security benefits to be self-supporting.

The number of immigrants sixty years or older in 1980 who entered during the 1970s was only 262,000, just 7 percent of the sixty years and older foreign-born population. More data needs to be gathered, of course, to determine the extent to which this explains the increase in alien participation in the SSI program.

The intersection of immigration policy and public benefits policy is a complex topic that episodically captures national attention, both among policymakers and the general public. In times of great labor force needs and abundant opportunity, there tends to be little attention to the domestic context of immigration. In times of slow or uncertain growth, restricted budgets, and reduced opportunity, sensitivity to domestic impact is heightened.

Now, with reform efforts underway on several major domestic policies, the effect of immigration-particularly illegal immigration-has been questioned. Immigration policy is viewed as yet another area ripe for reform. In this context, the Commission has examined closely the existing relationship between immigration and public benefit policies and their impact. The primary cause of concern to both the public and to the Commission is the lack of effective enforcement at our borders and the resulting presence of many aliens who have entered illegally. The Commission found that inconsistencies in immigration and benefits policy undermine the credibility of both.

The Commission believes that decisions on benefits eligibility should be consistent with and support the objectives of immigration policy. Legal immigrants enter the United States under U.S. law because their admission is considered to be in the national interest. The Immigration and Nationality Act delineates several categories of admission, most of them defined by the immigrant's connection to a U.S. resident or employers. Even in the category most characterized by humanitarian rather than strict national interest-refugee admissions-priority is given to individuals facing persecution because of their ties to the U.S. government, a U.S. resident, or a U.S. company. The Commission believes that benefits policy should reaffirm that the nation considers legal immigration to be in the national interest. Both the immigrants themselves and the broader society have responsibilities toward ensuring that immigrants are, and continue to be, productive members of our social community who, if they need help, can benefit from the established safety nets.

The Commission recommends against any broad, categorical denial of public benefits to legal immigrants. No federal benefit program currently denies eligibility on the basis of alienage to legal immigrants. In some needs-based public assistance programs, such as SSI, AFDC, and Food Stamps, as a means of enforcing the public charge provision for exclusion and deportation, current law requires that program eligibility workers "deem" sponsor income as available to immigrants in determining financial responsibility.

In other social insurance programs, such as social security and Medicare, an immigrant becomes eligible on the same basis as citizens-through sufficient payroll contributions to the trust funds. There is a five-year residency requirement for enrollment for elderly immigrants who have not contributed sufficiently to the Medicare trust funds.

A considerable amount of public debate has focussed on the issues of eligibility of legal immigrants for public assistance programs. Indeed, during the past year a number of proposals for curtailing immigrant eligibility have been made. While some measures would affect all legal immigrants, others are aimed more specifically at individuals coming into the country for family reunification purposes. The proposals range from making all legal immigrants ineligible for all federal assistance programs until such time as they naturalize, to extending for some federal programs the time period during which a sponsor's income is counted or "deemed" available to determine need.

So what do we do about this? The Commission believes the following principles should guide policy on the benefits eligibility.

The safety net provided by needs-tested programs should be available to those whom we have affirmatively accepted as legal immigrants into our communities. The U.S. admits immigrants on the basis that they will not be a public charge. However, circumstances may arise after an immigrant's entry that create a pressing need for public help-unexpected illness, injuries sustained due to a serious accident, loss of employment, a death in the family. Under such circumstances, legal immigrants should be eligible for public benefits if they meet other eligibility criteria. We are not prepared to remove the safety net from under individuals who, we hope, will become full members of our polity.

A policy to categorically deny legal immigrants access to such safety nets based solely on alienage would lead to gross inequities between very similar individuals and undermine our immigration goals to reunite families and quickly

integrate immigrants into American society. For example, while two children in the same family may be equally poor, one may be a legal immigrant and, under proposals to deny benefits to legal immigrants, would be ineligible for assistance, while the other may be a citizen-by virtue of being born after the family arrives in the U.S.-and eligible for assistance.

The inequities for the legal immigrant child grow if eligibility is linked to citizenship, rather than a specified time, since the child may not naturalize, by law, until he or she is eighteen years of age. The only route to citizenship prior to that age is through the naturalization of his or her parent. If there were a categorical denial of eligibility to all legal immigrants and the parent is unable or unwilling to naturalize, the child would suffer the consequences of a parental action that he or she cannot remedy.

Sponsors should be held financially responsible for the immigrants that they bring to this country. In particular, the Commission recommends making affidavits of support signed by sponsors legally binding for a specific period of time and the development of mechanisms to enforce sponsors pledges of financial responsibility.

Affidavits of support are one means to ensure the Consular Officer that the alien will be supported in the United States and will not become a public charge. In accordance with Board of Immigration Appeals [BIA] rulings, the signatory sponsor's ability to provide the promised support must be given due consideration in determining whether to exclude a person as likely to become a public charge. Some courts, however, have held that such affidavits of support impose only a moral-and not a legal-obligation on the signatory sponsor.

Thus, as affidavits are not legally enforceable, assurance that the alien will not become a public charge has relied primarily on the "deeming rules" applied by the statutory requirements that apply to sponsored immigrants in three federal means-tested entitlement programs-AFDC, SSI and Food Stamps. The deeming rules apply only to sponsored immigrants and are not used if a sponsored immigrant becomes blind or disabled after entry into the U.S., if an immigrant's sponsor has died, or if a sponsor's income and resources are depleted unexpectedly after the immigrant's entry. Also, refugees are statutorily exempt from deeming rules since their entry is based on humanitarian considerations rather than on family unity.

In 1993, the sponsor deeming period for SSI was temporarily extended to five years after admission. This change, authorized for a period of two fiscal years, resulted in savings that financed an extension of the Emergency Unemployment Compensation program. This use of immigrant eligibility revisions for budgetary advantage is a precedent that has opened the door to further revisions to immigrant eligibility in the current debate on welfare reform.

This extension of the deeming period for SSI resulted in part from the increased attention to the public charge issue and in part to data showing a rapid increase in SSI utilization by immigrants, many of whom are elderly and sponsored by their families. For example, in 1993, immigrants represented about 12 percent of the total SSI caseload and about 28 percent of the aged caseload, compared to 3 percent and 6 percent, respectively, in 1982. About 25 percent of all immigrants receiving SSI are legal immigrants who are not likely to have sponsors-primarily refugees, but also asylees, parolees, and others. The remaining 75 percent are legal permanent residents who are likely to have sponsors. One-third of these began to receive SSI in the year immediately following the end of the sponsor deeming period.

These data can be interpreted in various ways. Some believe that these elderly immigrants, sponsored by their families, have always intend to apply for SSI benefits as soon as the deeming restrictions are removed. They argue that, at the time of entry, these elderly individuals have no intention of being self-supporting and that their sponsoring relatives have no intention of honoring their sponsorship role beyond the deeming period, creating precisely the situation the public charge provision is supposed to prevent.

On the other hand, no laws have been broken and the data do not imply that there is any specific fraudulent activity occurring. Sponsors and their elderly immigrant relatives are merely following the rules of program eligibility as they have evolved over the years.

The one conclusion that can be unequivocally drawn from the data is that the deeming policies have generally been effective in preventing sponsored immigrants from receiving federal welfare benefits during the deeming period. However, under federal welfare benefit programs, the deeming rules apply even if immigrant sponsors are not actually

providing financial support to the immigrant they have sponsored. As the affidavit of support has been judicially interpreted as a document that is not legally binding, there is currently no legal procedure to compel sponsors actually to provide such support. It is possible that a sponsor may refuse to provide financial support to the immigrant but, due to the sponsors income and resources, the immigrant also may be ineligible for federal welfare benefits as a result of the deeming rules. The immigrant, may, however, be eligible for state and local assistance programs as these programs generally do not take into account sponsor's income in determining eligibility for benefits.

There are no data to indicate the prevalence of such sponsor abandonment of immigrants. Some experts argue that such cases are relatively rare, particularly in situations where the sponsor is a close relative of the immigrant, such as a son or daughter of an elderly immigrant. Some states and localities complain, however, that sponsored immigrants utilize their programs while awaiting the end of the deeming period for federal programs. Making the affidavit of support a legally-binding document is necessary to close this loophole in the current sponsor deeming policies.

A legally-enforceable affidavit of support is a necessary complement to deeming policies. Deeming is used not only for immigrants, but for others as well, to ensure that the income and resources of legally-liable individuals are taken into account when determining an applicant's eligibility for benefits. For example, under the SSI program, there are both spouse-to-spouse and parent-to-child deeming policies, in addition to the sponsor-to-alien deeming policy. Making the affidavit legally binding would establish the legal, financial relationship between sponsors and immigrants. Deeming policies would continue to allow benefit programs to take this relationship into account when determining a sponsored immigrant's level of financial need as part of the eligibility determination process. In defining the sponsor's responsibility, special consideration should be give to the issue of medical care.

It is likely that making the affidavit of support legally binding will serve primarily as an effective deterrent to sponsors. There is reason to assume that most citizens and legal permanent residents will voluntarily comply with such a legally-binding affidavit. But to be fully credible, mechanisms must be developed to enforce such a new legal requirement.

Consideration should be given to the particular enforcement mechanisms developed to actually enforce the affidavit, so as to avoid unnecessarily complex and costly new regulations or bureaucracies. Federal, state, and local governments should be allowed to consider the sponsor/immigrant relationship on the same legal basis as current parent/child and spouse/spouse relationships and to hold sponsors to the same standards of financial responsibility with regard to the immigrant as are currently applied to spouses and parents of children. If an immigrant claims that a sponsor is not honoring his or her financial obligation, courts could render judgments of support on behalf of the immigrant and initiative procedures to ensure that support. Also the INS and the Department of State should review their policies to determine if immigration-related sanctions should be applied against sponsors who do not abide by their responsibilities.

Finally, making the affidavit of support legally binding also should provide states the authority to ensure that sponsors do not shift their financial responsibility to state and local public assistance programs. As some courts have determined that states cannot implement the same type of deeming programs for their public assistance programs as the federal government now does for its programs, this is an important protection.

Abuse of the public charge provision should be grounds for deportation. A serious effort should be made to enhance and enforce the public charge provisions in immigration law to ensure that legal immigrants do not require public assistance and to provide clear procedures for deporting individuals who become public charges within five years after entry for reasons that existed prior to entry. In particular, the Commission recommends that deportation apply to sustained use of public benefits.

Specific provisions within U.S. immigration law are designed to ensure that those person seeking admission to this country will contribute to it, not merely take advantage of its resources and the generosity of its people. For example, U.S. immigration law currently bars the entry of those who are likely to be a public charge and contains provision for the deportation of individuals who become public charges within five years-unless they require aid for reasons that developed after entry. Effective enforcement of these provision helps minimize the number of legal immigrants who need or depend on public assistance.

These are the basic Commission recommendations that would apply to a discussion of SSI and immigrants. I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan
Chair, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on Appropriations
Subcommittee on Appropriations for the Departments of
Commerce, Justice, State, the Judiciary and Related Agencies
March 29, 1995

Mr. Chairman, members of the subcommittee, thank you for providing this opportunity to testify today. I am Barbara Jordan, the Chair of the Commission on Immigration Reform. I am accompanied by the Commission's Executive Director, Susan Martin.

Before I begin my formal testimony, I must commend this committee on its use of new technology to bring the work of the Congress closer to the American people. As you will hear later in my testimony, the Commission shares your belief that the federal government must tap new technologies in order to make the work of government efficient and in touch with the demands of the American public.

The Commission on Immigration Reform was created by the Immigration Act of 1990. We are a fully bipartisan body. In addition to the Chair, we have eight members who were appointed by the majority and minority leadership in each house of Congress.

The Commission's mandate is to examine and make recommendations to this Congress on the implementation and impact of U.S. immigration policy. We are required to make interim reports as issues arise and a final report in September 1997. The Commission issued its first interim report in September 1994. In calendar year 1995, we intend to issue three reports with interim recommendations on a range of issues from legal immigration numbers and categories to the handling of migration emergencies and the removal of deportable aliens from the United States. In addition, we continue to pursue our long-term agenda to assess the economic, social, demographic and other impacts of immigration on the United States.

This morning I would like to describe briefly the recommendations the Commission already has made in the hopes that they will be useful to this committee in setting FY 1995 appropriations not only for the Commission, but also for other immigration-related agencies. I will then turn to our plans for this fiscal year and our request for next year's appropriations.

The Commission's 1994 report to Congress was entitled *U.S. Immigration Policy: Restoring Credibility*. The title is telling of our recommendations. The Commission believes it is essential to control illegal immigration if we are to have a credible immigration policy. We believe legal immigration is in the national interest, but see illegal immigration as a threat both to our long tradition of immigration and to our commitment to the rule of law.

The Commission recommends a comprehensive, seven-point strategy to restore credibility. Let me tell you that the strategy is neither cheap nor painless. There are no quick fixes to our immigration problems; there are no inexpensive solutions. For too long we have neglected immigration as a public policy issue and now must pay for the consequences.

Four points in our report call for special attention. First, we need improved border management. The Commission calls for a strategy of prevention of illegal entry and facilitation of legal ones in the national interest. The concept is simpler, of course, than its achievement. The Commission was highly impressed with the border operations in El Paso that aim to prevent illegal entry. It is far better to deter illegal immigration than to play the cat and mouse game that results from apprehensions followed by return followed by re-entry. To accomplish a true deterrence strategy will require additional

personnel as well as a strategic use of technology and equipment. We will also require new measures of effectiveness because apprehensions alone cannot measure success in preventing illegal entries. Our goal should be zero apprehensions-not because aliens get past the Border Patrol but because they are prevented entry in the first place.

While we tighten our control over illegal entry, we must also reduce the long waiting times at our ports of entry. It is ridiculous that people with legitimate border crossing cards feel it is more convenient to cross illegally than go through our ports of entry. But that is the case. Our own delegation waited for one and one-half hours to cross from Juarez into El Paso-and this wasn't even at rush hour. In an age of NAFTA, we must do a better job of handling the legitimate border travel. The Commission supports the development of a land border user fee whose resources would be used to open more lanes, add more inspectors and, if necessary, more ports of entry to speed this traffic.

Our second set of recommendations would reduce the magnet that jobs currently present for illegal immigration. We have concluded that illegal immigrants come primarily for employment. The Commission believes that we need to enhance our enforcement of both employer sanctions and labor standards. But, to make employer sanctions work, we must improve the means by which employers verify the work authorization of new employees. The Commission believes the most promising option is a computerized system for determining if a social security number is valid and has been issued to someone authorized to work in the United States. We are pleased that the Administration has endorsed our recommendations in this area, and we look forward to working with INS and the Social Security Administration on the design of pilot programs that will phase in and test this new verification approach. I urge this committee to provide the funding needed to develop the computerized system and implement the pilot programs.

Third, the Commission urges greater consistency in our immigration and benefits policies. We believe that illegal aliens should be eligible for no public benefits other than those of an emergency nature, in the public health and safety interest, and constitutionally protected. On the other hand, we urge the Congress to retain for legal immigrants eligibility for our safety net programs. The United States screens legal immigrants to determine if they will become public charges, but unforeseen circumstances-deaths, illnesses-occur. The Commission does not want to see individuals whom we have invited to enter become vulnerable when such situations arise. On the other hand, the Commission strongly supports efforts to make our public charge provisions work. We do not want the U.S. taxpayer to bear a burden when there is a sponsor in this country who has pledged to provide support for an immigrant. The affidavits of support signed by sponsors should be legally binding, and the provisions for deportation of those who do become a public charge-for reasons known prior to entry-should be strengthened.

The Commission also made recommendations regarding impact aid for states and localities experiencing the fiscal effects of illegal immigration. We believe the federal government has a responsibility in this area. The first responsibility is to control illegal entries; the second is to help states and localities with their fiscal problems. However, we are skeptical of some of the data used to calculate these fiscal impacts. At present, the Commission believes that the data to support reimbursement of criminal justice costs are sound and we urge immediate reimbursement of these costs. We are not prepared to make such a recommendation regarding medical and education costs. We also urge that any impact aid provided require appropriate cooperation by states and localities in the enforcement of immigration policy.

Our fourth area concerns the removal of criminal aliens. The Commission supports enhancement of the Institutional Hearing Program that permits the federal government to obtain a deportation order while criminal aliens are still serving their sentences. Once the sentence is over, it is far easier and less expensive to remove the alien after an IHP proceeding. The Commission also recommends further negotiation of bilateral treaties that will permit deportation of criminal aliens to serve their sentences in their home countries.

The Commission has provided copies of our full report to the committee so I will not go into details on the other recommendations. Let me turn my attention to this year's work. The Commission is currently at work on three reports while engaging in research needed to answer the longer-term questions in our legislative mandate. Our budget justification spells out these reports in some detail so let me emphasize our work in only one of these areas: legal immigration.

At the request of the House and Senate Judiciary Committees, the Commission has accelerated its examination of the legal immigration system in order to make recommendations by June 1. Last week, we spent a day of Executive Session

debating basic principles to underlie our legal immigration policies. We discussed the national interest in family reunification, employment-based immigration, and diversity, refugee, and humanitarian admissions and we set out the objectives that each of us wants from legal immigration. During the next two months, we turn our attention to the numbers and criteria for admission that fulfill these objectives, the procedures we use to determine the admissibility of individuals applying for permanent and temporary admission, and other similar issues.

We are also looking at naturalization and the civic integration of newcomers to the United States. I, for one, would like to see all eligible immigrants become U.S. citizens-and become citizens for the right reasons, not to receive some federal benefit but to be fully participating members of our polity. Right now, there are too many barriers to naturalization. In some districts, it can take two years to complete the process. We plan to have recommendations to improve this situation.

Now, for FY 1996. We have requested an increase in appropriations for next fiscal year because we see a significant increase in our work. We expect and support major administrative and legislative action this year on immigration reform. The Commission feels an obligation to monitor the implementation of these initiatives so that we can give an independent assessment to the Congress of their effectiveness in reducing illegal immigration.

In addition to these assessments, the Commission will also turn its attention to structural issues in the implementation of U.S. immigration policy. Having made interim recommendations on improvements we urge regarding both legal and illegal immigration, the Commission will examine the adequacy of the structures we have in place to implement such policy. In our 1994 report, we already raised a number of questions regarding implementation and coordination of policy. For example, we have concerns about our border management apparatus, the coordination between the INS and the Department of Labor in worksite investigations, and the infrastructure to support effective enforcement and service delivery. These and other similar issues will be the focus of our attention in the next fiscal year. The Commission also will continue its assessment of the labor market, fiscal, social, and demographic impacts of immigration, as required by our statutory mandate. We already have begun two major, two-year research initiatives that will provide cutting-edge information on these issues. One is an expert panel at the National Academy of Sciences to assess the literature on the demographic, labor market, and fiscal effects of immigration, to undertake new research to fill gaps in current understanding, and to report to the Commission on their conclusions regarding the short-term and long-term implications of immigration for U.S. society. The second is a binational study with Mexico that should provide new information on the scale, characteristics, and impact of the largest single source of both legal and illegal immigration to this country. This binational study will permit data collection in both countries, providing answers to questions that cannot be examined adequately with data from the U.S. alone.

I thank you again for this opportunity to discuss the work and recommendations of the Commission on Immigration Reform. I also want to state for the record our commitment to work with this Committee as you address the very challenging issues arising in the appropriation of funds to improve implementation of immigration policy. We are the creation of Congress and offer ourselves as a resource to help you in your work. Dr. Martin and I would be pleased to answer questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan
Chair, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on the Judiciary
Subcommittee on Immigration and Claims
March 30, 1995

Mr. Chairman and Members of the Subcommittee, on behalf of my fellow members of the U.S. Commission on Immigration Reform, I want to thank you for this opportunity to testify. This bipartisan Commission recognizes and deeply appreciates the support which we have received from Congress, and this Subcommittee in particular.

In our first report to Congress last fall, U.S. Immigration Policy: Restoring Credibility, we sought to recommend a comprehensive strategy. We chose to focus much of that report on measures to control illegal immigration because growing frustration about it undermines our first commitment to legal immigration in the national interest.

Let me sum up the Commission's reasons for proposing that we develop a better system for worksite verification. Reducing the employment magnet is the linchpin of a comprehensive strategy to reduce illegal immigration. Illegal aliens are here for jobs. That is the attraction. So the only effective way to deter illegal immigration must include the worksite.

A better system for verifying work authorization is central to the effective enforcement of employer sanctions. The current system of verification is doubly flawed: it is too susceptible to fraud, particularly through the counterfeiting of documents; and it can lead to increased discrimination against foreign-looking and foreign-sounding authorized workers.

IRCA stipulates that all employers are required to verify all employees' identity and authorization to work. Employers are responsible for examining documentation establishing identity and employment eligibility and ensuring that the documents presented reasonably "appear" to be genuine and relate to the individual. This information is documented on the Employment Eligibility Verification Form [I-9 Form]. Under these verification provisions, employees can use a combination of more than twenty-nine different documents to prove identity and work eligibility.

The current process of employment verification has not functioned as the law intended to deter the hiring of undocumented aliens. The system may be thwarted easily by fraud. Widespread counterfeiting of documents that can be used for verification of identity and employment authorization has been reported since IRCA's implementation. Moreover, it is relatively easy to obtain genuine documents, such as birth certificates or drivers licenses, by fraudulent means. The ease of obtaining fraudulent employment eligibility documents has resulted in their increased use to satisfy I-9 requirements. The General Accounting Office [GAO] documented that 39 percent of unauthorized workers identified by INS investigators during a six-month period in 1987-1988 used proven or suspected counterfeit documentation to obtain employment. Other studies confirm similar levels of fraud. Because numerous documents-many of which may be unfamiliar to any given employer-may be shown to verify employment authorization, employers may have difficulty in determining if these documents meet the verification test, that is, that they "reasonably appear on their face to be genuine and to relate to the person presenting them."

Employer sanctions also have created problems for employees, who, if they are foreign-looking or foreign-sounding, may find themselves subject to unfair immigration-related employment practices. A number of government and private studies, including the Congressionally-mandated GAO study of discrimination, have documented practices that put a greater burden on foreign-sounding and foreignlooking applicants for employment. These include employer demands that such employees provide additional or different documentation, or that employers selectively use Form I-9 for presumed aliens but not for U.S. citizens.

Although it remains a matter of controversy whether these practices represent widespread discrimination caused by IRCA, the evidence appears consistent that even some well-meaning employers are confused by the requirements under IRCA and, as a result, violate the terms of the law. While the completion of a Form I-9 is a good faith defense against allegations of knowing hire of illegal aliens, in some cases, employers may be found to have constructive knowledge of the illegal status of their worker if they do not follow up on anomalies uncovered in the I-9 process. If they press for additional documentation because they think they have reason to believe an employee is an unauthorized worker (for example, the document does not appear to be the same as the one reproduced in the INS Handbook) and their reasoning is faulty, they may violate the antidiscrimination provisions of IRCA.

In explaining their concerns about the current verification process, employers also cite what they consider to be excessive administrative and paperwork requirements. As a recent addition to tax records and other compliance and recordkeeping requirements, the I-9 is seen by employers as one more paperwork burden. Oftentimes employers photocopy all documents presented to satisfy the I-9 process as evidence to avoid a knowing hire challenge-a formidable increase to their paperwork volume. Further, the technical complexity of the requirement places significant demands on the employer in the form of compliance instructions, training of staff, and contact time with candidates for employment.

The sheer number of documents available for use in verification presents challenges for effective implementation of employer sanctions. Some efforts are underway to correct this situation. INS has proposed regulatory changes that would reduce the number of documents to be used for verifying work authorization for aliens. In addition, voter registration cards will be eliminated from the list as they generally do not contain a photograph needed to verify identity. The Commission believes that these efforts will not solve the problems inherent in the current verification process for several reasons. Reducing the long list of documents by a few documents would still leave too many documents for effective verification; it also would be unlikely to reassure employers sufficiently about the security of the system and may even add to employer confusion and lead to a potential increase in differential treatment. Counterfeiting or the fraudulent use of documents still would continue.

The Commission reviewed options that would reduce the number of acceptable documents even more stringently. The proposals that all aliens use an INS-issued document and all citizens present one of a limited number of documents, such as a passport, birth certificate, social security card, and/or driver's license, still contain a basic flaw: the employee would still have to self-identify as an alien or citizen. Such proposals would continue to permit considerable amounts of fraud if illegal aliens declare themselves to be citizens and present counterfeited documents. They potentially also would permit perpetuation or increase of current levels of differential treatment if employers question whether foreign-looking or -sounding citizens are citizens and require an INS-issued document.

Recognizing the problems inherent in strategies to reduce documentation but not to change the overall system of verification, the Commission set a number of criteria by which it measured the potential impacts of more comprehensive reform.

First, a new system would have to be potentially more reliable and less susceptible to unfair immigration- related employment practices than the present one. Any solution would have to take into account that most documents now can be counterfeited within a relatively short time and for a cost that would be recoverable from the sale of the counterfeit documents. Employers generally do not have sufficient expertise to recognize counterfeit documents and, therefore, require a simple, effective means of validating the information presented by new workers. Moreover, the new system would need to apply not only to aliens, but also to U.S. citizens; otherwise, problems of fraud could continue (illegal aliens could claim to be U.S. citizens) and/or unfair immigration-related employment practices may increase (employers could set different documentation standards for all foreign-looking and -sounding individuals).

Second, the new system would have to meet civil liberties and privacy standards. The new verification process should provide protection against use of the system for purposes other than those specified in law. The verification system should protect the privacy of the information to be used in verifying work authorization.

Third, the system would have to lessen the time, resources, and paperwork spent by employers in verifying work authorization. The Commission is persuaded that the current I-9 process requires excessive commitment of time and resources because of the complexity of the verification process. Any new system should be simple to use and require as

little paperwork as possible for employers. It also should be simple in overall design, so that enforcement may focus on substantive violations and not become preoccupied with paperwork violations rather than knowing hire of unauthorized workers.

Fourth, the new system would have to be as cost-effective as possible. Given that illegal aliens represent at most a very small portion of the total U.S. labor force, the Commission does not think it appropriate to recommend strategies with costs out of proportion to the problem to be solved. To improve verification without undue costs is possible, we believe, if a new verification system builds to the extent possible on the existing responsibilities, capabilities, and data systems of federal agencies rather than if it were to create new mechanisms that would be used only for verification of immigration-related work authorization.

Fifth, more effective verification likely would require a companion initiative for improvements in the integrity of the underlying or "breeder documents" (such as birth certificates) used to establish identity in this country. Birth certificates are easily counterfeited or easily obtained through counterfeit means. Since counterfeiting operations have become multimillion dollar businesses, meaningful penalties would be needed to deter the counterfeiting of documents. New enforcement measures, commensurate with the scale of these operations, are needed to identify and destroy the counterfeiting rings.

The Commission believes that the most promising option for secure, nondiscriminatory verification is a computerized registry using data provided by the Social Security Administration [SSA] and the Immigration and Naturalization Service [INS].

Having assessed dozens of options for verification of work authorization, the Commission believes that the proposed computerized registry best meets the criteria described above. As envisioned by the Commission, the computerized registry would be used to verify that a social security number is valid and has been issued to the individual who is being hired. This database would be created and updated from SSA and INS files, but not connected to either. From SSA would come a limited set of data: name; social security number; and several other identifiers, such as date of birth and mother's maiden name. From INS would come information about the immigration status of lawfully-admitted immigrants, nonimmigrants, and other aliens permitted to remain temporarily or permanently in the United States. The INS data would also contain information about the duration of work authorization for aliens granted temporary employment permits.

The Commission believes the key to this process is the social security number. For decades, all workers have been required to provide employers with their social security number. The computerized registry would add only one step to this existing requirement: an employer check that the social security number is valid and has been issued to someone authorized to work in the United States.

Most citizens obtain a social security number before age eighteen, and the majority obtain it immediately after birth because it is required if a parent requests a tax exemption for a child. SSA has programs with all but four states to issue social security numbers at birth to U.S. citizens. According to SSA, among the forty-six states that participate in the Enumeration at Birth system, 85 percent of the parents of newborns elect to participate.

SSA already has taken steps to make it more difficult for unauthorized aliens to obtain social security numbers by requiring any individual over age eighteen who requests a social security number to have a face-to-face interview. SSA checks immigration status before issuing the social security card to anyone who did not receive a social security number as a child because they immigrated to this country. SSA also keeps information that designates whether the alien has full work authorization or is temporarily authorized to work with permission of INS. SSA will give social security numbers to individuals not authorized to work if needed to open up bank accounts or for other reasons not related to work, but the social security cards issued to these individuals clearly state that they are ineligible for employment.

Under the proposed verification system, the employer would not ask individuals if they are citizens or aliens. Instead, the individuals would be asked for a name and social security number. This information could then be verified with the computerized registry. The employer would be given a confirmation number if the information given by the employee matches the database information. This verification number would be kept by the employer and could be used as an affirmative defense if the employer is accused of knowingly hiring an illegal alien. If, for any reason, a match is not

found within the system, the employer would receive acknowledgement that the verification process was carried out but that, as confirmation could not be made within the system, the employee should check with the local social security office to correct the problem. It would not be necessary-or possible-for the inquiry to give to the employer information about the reason why a match was not effected.

Also under this approach, in situations where the worker has temporary authorization to work, the employer could be told the individual has work authorization but to reverify as of a particular date when the eligibility expires. By the time of reverification, the information would be updated to include the individual's current employment eligibility status. The computer registry also could verify that an alien granted authorization to work for a specific employer, for example, under certain nonimmigrant visas, did not obtain employment elsewhere. Some of the costs of the new system may be offset by savings if the computer system allows extension of work eligibility to be done through updating of the database rather than through issuance of a new INS employment authorization document [EAD].

The Commission believes a computerized registry based on the social security number is the most promising option for verification because it holds great potential for accomplishing the following:

- **Reduction in the potential for fraud.** Using a computerized registry rather than only an identification card guards against counterfeiting of documents. It provides more reliable information about work authorization.
- **Reduction in the potential for discrimination** based on national origin and citizenship status, as well as inappropriate demands for specific or additional documents, given that employers will not be required to ascertain whether a worker is a citizen or an immigrant and will have no reason to reject documents believed to be counterfeit. The only relevant question will be: "What is your social security number?"
- **Reduction in the time, resources, and paperwork** spent by employers in complying with the Immigration Reform and Control Act of 1986 and corresponding redirection of enforcement activities from paperwork violations to knowing hire of unauthorized workers. Through use of this system, employer confusion will be greatly reduced as employers will not need to rely on faulty documents.

The Commission recommends that the President immediately initiate and evaluate pilot programs using the proposed computerized verification system in the five states with the highest levels of illegal immigration as well as several less affected states. We are pleased that the President's immigration initiative and FY 1996 budget includes funding to begin the pilot programs.

A pilot program will: permit the testing of various approaches to using the proposed verification system; provide needed information about the advantages, disadvantages, and costs of the various approaches; develop and evaluate measures to protect civil rights and civil liberties; and ensure that any potential obstacles, such as the quality of the data used in the registry, are addressed prior to national implementation. Assuming the results are positive, Congress should pass the necessary statutory authorities to support more effective verification.

The Commission recommends that these projects be undertaken in the high impact states because that is where the bulk of the illegal alien problem is. We did not recommend that the pilots be undertaken throughout all of the five states immediately. Pilot projects should start small. At each step, we should have results to determine what to do next.

The pilot program should incorporate a number of features:

- A means by which employers will access the verification system to **validate the accuracy of information given by workers.** We have received conflicting testimony about the best way to check the applicant's identity. We have heard proposals for a more secure social security card, a counterfeit-resistant driver's license, and a telephone verification system that does not rely on any document. Several different options could be tested simultaneously in different states. The pilot program presents an opportunity to determine the most cost-effective, fraud-resistant, and nondiscriminatory method available.

  Counterfeit-resistant driver's license or state-issued identification documents. An almost universal identification document is the driver's license or identity document issued by Departments of Motor Vehicles [DMVs]. These documents are obtained in most states with a birth certificate, social security number, driver's license from another state, or other documents. During the past few years, there has been significant progress in increasing the security

of these documents, pointing to further improvements that could be made. In the issuance of drivers' licenses, states are typically using secure paperstock, lamination, and other security features with a four to five year cycle for license replacement. Several states are issuing licenses made of hard plastic with a magnetic stripe. Alteration of the card is difficult and an operation for mass producing of replicates would be very expensive. The use of a smart-card chip and a biometrics identifier on the license is currently being explored through the Department of Transportation. Digital imaging, a new technology currently used for Virginia drivers' licenses, allows for automated capture, display, and comparison of current and previously recorded signatures and photographs. Employers would not be required to assess the validity of the drivers' licenses, however. The computer registry would tell an employer if the name and social security number on a license are valid. In this way, even a very good counterfeit would not pass muster.

Social security cards. Existing social security cards cannot serve as effective identifiers of the holders of those cards. While currently issued cards are more resistant to counterfeiting than earlier versions, many easily counterfeited cards remain in circulation. There are forty-four versions (twenty-six original and eighteen replacement) of the social security card. As of June 1993, 63 percent of the total number of active card holders had been issued the new counterfeit-resistant card, still leaving a substantial number of valid older documents in use. (There is no way of knowing how many counterfeit cards are currently in use or how many illegal aliens may have obtained valid social security numbers through fraudulent means.) Even the new cards have problems as identifiers; these cards do not have any identifying information other than the individual's name. A number of proposals have been put forth in Congress and elsewhere for the development and reissuance of a more counterfeit- resistant social security card. Even apart from the immigration-related reasons for a more secure social security card, arguments in favor of reissuance point to the need for greater integrity in the social security system itself. Critics of these proposals point out the cost and inconvenience to the public of a requirement for reissuance of the social security card. Further, if a photograph is used on the new issuance, it will be necessary for cards to be reissued periodically. SSA estimates the initial cost would be in the range of $2.5 billion. The pilot program would provide an opportunity to determine the cost-effectiveness of proposals to reissue the social security card.

Telephone verification. Some experts testified that a stand-alone telephone verification system could work to verify identity if workers are asked for information that they alone know. Many credit card and bank companies use a Personal Identification Number [PIN] to verify identity. Under this proposal, employers would enter individuals' social security numbers and workers would enter a PIN that only they knew. Alternatively, or in conjunction with the PIN, employees could provide a set of identifying information: for example, name, social security number, mother's maiden name, and date of birth. The pilot would test whether a telephone verification process that requires no documentation affords sufficient protections against fraud and discrimination.

Experts note that under any of these systems, the computer system could have a built-in process for logging and auditing inquiries to identify likely fraud. For example, if the same social security number was used too often or in too many locations, the computer system would record the incidence. The system then could inform the employer that the employee must reconfirm the information in the database. The authorized worker would benefit from learning that others were using his or her social security number. The social security number might then be canceled and the authorized worker issued a new number. The unauthorized worker could not reconfirm the information and, therefore, would not be able to continue in that employment. The process would also permit estimates of likely fraud to use in determining the efficacy of the verification system.

- **Measures to ensure the accuracy of and access to the specific data needed** to ensure that employers have timely and reliable information when seeking verification of work authorization. Improvements to the Social Security Administration and INS databases must be made to ensure that these data are available. Both the INS and SSA are already improving their data systems.

  Both houses of Congress already have earmarked funds in the INS FY 1995 appropriation to enable the agency to undertake such needed reforms. INS currently is completing the process of combining several databases into one integrated system. Nonimmigrant and refugee data are now integrated into the Alien Status Verification Index [ASVI] database, that is used in the benefits verification process, the System for Alien Verification of Eligibility

[SAVE], and the Telephone Verification System [TVS] pilot for employment eligibility verification. In FY 1995, the INS information systems division will almost double its budget, from $110 million to $200 million, to improve the infrastructure of the data systems.

The Commission welcomes these steps and encourages INS and SSA to take seriously their responsibility to have accurate, accessible data fully protective of privacy. Even with these improvements in the source data for the computerized registry, procedures must be developed to ensure timely and accurate extraction as well as updating and correcting the needed data. The Commission encourages INS and SSA to cooperate in this endeavor as the proposed registry would be built upon and-once implemented-would support the primary missions of both those agencies. Each agency has a vested interest in ensuring that its data are accurate, even apart from their common interest in ensuring that unauthorized workers do not obtain jobs. It is unacceptable that neither agency's records currently can provide needed information quickly. Resources requested and used for employment and benefit authorization purposes can be seen largely as enhancing or parallel to the resource needs of the larger mission of these agencies.

- Measures to ensure against discrimination and disparate treatment of **foreign-looking or -sounding persons**. The Commission believes that the least discriminatory system would have the same requirements for citizens and aliens alike. To reduce the potential for discrimination and increase the security of the system, the Commission also believes that employers should not be required to ascertain immigration status in the process of verifying authorization for employment. Their only requirement should be to check the social security number presented by the employee against the registry and record an authorization number to demonstrate that they have done so.

- **Measures to protect civil liberties**. It is essential that explicit protections be devised against use of the database-and any card or any other means used to gain access to it-for purposes other than those specified in law. The uses to be made of the verification system must be specified clearly. We believe the worksite verification system could be used, without damage to civil liberties, for verifying eligibility to receive public benefits. However, it should be stipulated that no one should be required to carry a card, if one is used, or to present it for routine identification purposes. Also, there should be penalties for inappropriate use of the verification process. Putting these provisions in law, rather than regulation, would make it more difficult to change them later in a manner that would evade protection of civil liberties.

- **Measures to protect the privacy of the information included in the database**. The Commission is aware of the proliferation of databases and the potential for the invasion of privacy by both government and private agencies. The computer registry recommended by the Commission will be drawn from an existing national database, the Social Security Administration computer system. Given the scope of the registry, it is essential to build in explicit provisions for protecting privacy. As with other aspects of our recommendations related to civil liberties, these safeguards should be made by law, not just regulation. The resultant computer system should incorporate appropriate technical safeguards regarding authorized users' access to individual information. In establishing privacy safeguards, it is important to take into account that, while access to any one piece of information may not be intrusive, in combination with other information such access may violate privacy. In particular, safeguards must ensure that information about specific individuals-other than the limited information to be provided as a part of the verification process itself-cannot be obtained from the database. To create a viable system, institutions and individuals with expertise in privacy matters should be involved in the development and assessment of the pilots. For example, the Computer System Security and Privacy Advisory Board created by the Computer Security Act of 1987 to identify and advise on security and privacy safeguard issues relating to federal computer systems should be involved in this process.

- **Estimates of the start-up time and financial and other costs** of developing, implementing, and maintaining a national system in such a manner that verification is reliable. The establishment of the proposed computer registry is the top priority during the pilot process and the key to the effectiveness of the process. While the record structure is simple, ensuring the quality of the source data is essential. Updating the information in a timely way is another basic, but very important, requirement. The database would contain only one-half dozen data elements (name, social security number, date of birth, place of birth, mother's maiden name, immigration status code, for example), and therefore would be quite straightforward from a programming viewpoint. However, ensuring that

these elements are complete and correct for all records will require significant start-up costs in making the necessary improvements to existing databases, particularly for INS.

Informal estimates by the Social Security Administration indicate that the cost of design and development of the combined SSA/INS database is $4 million over a two-year period. Annual cost of maintaining and operating the verification system is estimated at about $32 million. This figure maintains the computer registry itself, the costs of operating the automated system for checking social security numbers against it, operator costs for calls that cannot be handled automatically, and telephone lines for an 800-number to be used by employers.

Correcting errors in the INS and SSA databases will require the largest financial input. Discrepancies referred to SSA for resolution will cost approximately $122 million initially with an annual cost of $30 million. The cost of resolving discrepancies in the INS database will be additional. INS is already taking steps to improve its recordkeeping, but under the current plan, these improvements will take several years to accomplish. Additional appropriations will be needed to speed that process and ensure that accurate information will be available in a timely manner. Correcting discrepancies in the existing SSA and INS databases would be good investments, even if the computer registry were not at issue.

- **Specification of the rights, responsibilities, and impact on individual workers and employers**. The pilot program will need to determine a number of important issues related to the rights, responsibilities, and impact upon the users of the verification system. These include, for example, what individuals must do, how long it will take for newly authorized workers to get on the system and to correct inaccurate data, and what will be required of employers and at what expense.

  Provisions also must be developed to protect both workers from denial of employment and employers from penalties in cases where the information provided by the computer registry may be missing or inaccurate.

  Even with major improvements in the reliability of the data, the pilot programs will require mechanisms for timely manual secondary verification and an appeal when there is no match. Experience with existing databases, such as SAVE, indicate a sufficiently high error rate to merit further review. If the error rate is too high, the result may be discrimination against employees who come up as false negatives. To deter such discrimination, employers could be required to retain in employment those individuals until the employment authorization is confirmed (as in the current law, verification is a post-hire process). The current pilot project on telephone verification [TVS] has this provision.

- **A plan for phasing in of the system**. The Commission recognizes that the proposed verification system will result in financial costs. The system should be phased in to lessen the immediate fiscal impact. The pilot programs should test various phase-in procedures. Given the required levels of accuracy, reliability, and convenience required, the evaluation should help measure the cost of phasing in the system nationally.

The Commission recommends evaluation of the pilot programs to assess the effectiveness of the verification system.

The evaluation should include objective measures and procedures to determine whether current problems related to fraud, discrimination, and excessive paperwork requirements for employers are effectively overcome without imposing undue costs on the government, employers, or employees. The evaluation should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy. In carrying out the various components of the evaluation, study designs should be capable not only of identifying the degree to which the pilot alternatives achieve defined goals, but also of identifying why certain outcomes have occurred. In particular, the evaluation should assess the extent to which any identified strengths and weaknesses in the pilot programs are attributable to the computerized registry itself and/or the mechanisms used to access it. This information is essential to determining if the computerized registry should be maintained as a cost-effective mechanism for verification and, if so, what means of access should be used nationally.

The Commission supports INS efforts to improve its Telephone Verification System/SAVE [TVS/SAVE] database-but only as an interim measure.

The improvements are essential for improving the data needed for the new, more effective verification process. The Commission is aware of the inadequacies of the current INS data that would be used in the proposed system. The Commission does not endorse the TVS/SAVE program as a long-term solution to the verification problem because use of TVS/SAVE requires the inadequate mechanism of self attestation by workers as to their citizenship or alienage, thus making it easy for aliens fraudulently to claim U.S. citizenship. It also imposes requirements on legal immigrants that do not apply to citizens. Nevertheless, improvements in this database as well as the Social Security Administration database are essential to the development of a more secure, less potentially discriminatory verification system.

The current Telephone Verification System builds on the ASVI database that was established for the SAVE program. SAVE was designed for verification of legal status as it pertains to eligibility for federal assistance programs.

The following information is contained in the ASVI database: alien identification number; verification number; last name; first name; and an employment eligibility statement. The time-consuming aspect of the ASVI database is that often the system, for any number of reasons (e.g., files are not updated, there is a systems error, or the number provided is not functioning) cannot provide a response to A-number queries. When this happens the system refers the case for secondary verification. In FY 1994, (September - July) there was a 17 percent secondary referral rate for the SAVE system. A study of Phase I of the TVS pilot reported a 28 percent secondary referral rate. INS is already in the process of improving its system and is working to upgrade the ASVI database and reduce the need for secondary verifications. The Commission endorses INS initiatives to improve the SAVE/ASVI system as this step is necessary before a more secure system can be achieved.

Those are the Commission's recommendations on verification of work authorization. They are part of a comprehensive approach to immigration reform which this Commission proposes. I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Susan Martin
Executive Director, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on the Judiciary
Subcommittee on Immigration and Claims
May 17, 1995

Thank you for the opportunity to testify today on the work of the Commission on Immigration Reform as it relates to legal immigration reform. As you know, the Commission is mandated to examine and report on the impact of legal immigration on the U.S. economy, labor force, social relations, demography, natural resources, foreign policy, and national security. We have underway a number of research projects designed to provide a systematic analysis of these effects of immigration policy. In addition, the Commission undertakes site visits, field hearings, and expert consultations better to inform us of the strengths and weaknesses of U.S. immigration policy.

In the Commission's 1994 report to Congress, we provided a preliminary picture of legal immigration under the Immigration Act of 1990. The Commission now is considering options to improve legal immigration policies. The Commissioners plan to complete their deliberations by the end of this month. Barbara Jordan, the Commission's Chair, instructed me to tell you that she would be pleased to testify as soon thereafter as is convenient for you.

Today, I will present a brief profile of recent legal immigration, based on our 1994 report as updated by more recent statistics on FY 1994 admissions. I also will describe the process that the Commission has been following in developing the interim recommendations that will be available in June and touch briefly on the issues that the Commission is considering.

The legal immigration provisions of the Immigration Act of 1990 [IMMACT, P.L. 101-649] attempted to balance a number of competing interests by (1) encouraging overall limits on legal immigration through establishment of annual numerical targets for total immigration, (2) permitting continued reunification of close family members with a guaranteed minimum for family preference visas if there are increases in the number of immediate relatives of U.S. citizens seeking entry, (3) meeting present and future labor market needs by increasing the proportion admitted for employment-based reasons, giving higher priority to the entry of professionals and highly-skilled persons, and retaining a procedure for helping to ensure that foreign workers do not adversely affect employment opportunities for U.S. workers, (4) providing greater national origin diversity by offering new opportunities for migration from countries that have not recently experienced much emigration to the United States, and (5) establishing a timely and more efficient naturalization process.

IMMACT Effects On Imigration Levels

To accomplish these objectives, Congress significantly revised the INA. A note, however, about the statistics available to judge its effects: the principal provisions of IMMACT were not implemented until 1992 and immigrant admissions in 1992 were primarily from the pre-IMMACT backlog. Only the 1993 and 1994 admissions are reflective of the new policies on family and employment-based immigration. The Diversity Program did not go into effect until this fiscal year. The following analysis, therefore, must be considered preliminary.

Legal Immigration

Immigrants fall into two major categories: those whose numbers are subject to annual statutory limits and those whose numerical limits can change each year (primarily refugees) or who have no numerical limits at all. Overall admissions of

legal immigrants averaged about 640,000 annually during the five-year period prior to the implementation of IMMACT. These numbers include all immigrants, whether admitted within or outside any statutory limits. As the attached Table shows, overall admissions since IMMACT, just over 800,000 in FY 1992 and about 880,000 in FY 1993, dropped in FY 1994 to 798,394. (These numbers do not include adjustments to permanent resident status of the 2.7 million illegal aliens legalized under IRCA.)

Statutory Cap

IMMACT established a flexible worldwide level of 700,000 family-based, employment-based, and diversity immigration visas for FYs 1992-1994. In FY 1995, the worldwide level reduces to 675,000. Separate ceilings were set for each of these immigrant categories, and, as described below, subceilings were created within each category.

The total admissions under the statutory cap were about 662,000 in FY 1994.

Family-Sponsored Immigration. Concerned that a worldwide limit on family-sponsored immigration had a potential to disrupt family reunification, Congress established an overall cap that could be pierced if the number of immediate relatives of U.S. citizens, for whom there are no numerical limits, exceeded expectations. IMMACT established a minimum floor of 226,000 per year for numerically-limited, family-sponsored preferences to ensure that these visas would continue to be available. Should the number of unrestricted immediate relatives exceed 239,000 (465,000 less 226,000) in FYs 1992-1994 or 254,000 (480,000 less 226,000) after FY 1994, the family- sponsored cap would be pierced. Under the flexible cap, the number of spouses, minor children, and parents of U.S. citizens admitted in the previous year is subtracted from the overall numbers available for family sponsorship, and (as of FY 1994) the number of unused employment-based visas from the previous year is added to the total. In no event, however, can the remaining family-based visas be less than 226,000.

The family numbers were less than 500,000 in FY 1994. More specifically, the family numbers are divided as follows:

> *Immediate Relatives of U.S. Citizens*. There are no numerical limits on the admission of the spouses and minor children of U.S. citizens or the parents of U.S. citizens. The number of immediate relatives entering in FY 1994 showed a modest decline from previous levels, mostly attributed to a drop in the number of parents of U.S. citizens who entered. The total number of immediate family was just under 250,000.
>
> *Unmarried Adult Children of U.S. Citizens (FB-1)*. The FB-1 limit is 23,400 visas, plus any unused numbers from the siblings of U.S. citizens (FB-4) category, a reduction from the previous limit of 54,000 because Congress recognized that this category has always been underutilized (averaging 11,000 in the second half of the 1980s) and annual increases have been low. In FY 1994, about 13,000 immigrants entered in this category.
>
> Despite the worldwide low usage, waiting lists for FB-1 visas have existed for certain countries due to per-country limits, which are prorated among the various preferences. Prior to the implementation of IMMACT, some 29,000 Filipino applicants were on the waiting list, and those who had applied six years before were being admitted. Some 52,000 Filipino and 4,000 Mexican applicants now are on the waiting list. Mexicans who have been waiting for one year and Filipinos who have waited nine years are being admitted. This wait for unmarried Filipino adult children of U.S. citizens is considerably longer than the current five-year wait for unmarried adult children of permanent residents. IMMACT has thus exacerbated the backlog, which will continue to grow, as only 1,600 Filipino applicants will become eligible for admission in this category annually. While the real wait for new applicants cannot be predicted with certainty due to changing factors over time, even if the maximum number of Filipinos receive visas every year, it will take more than thirty years to admit the current 52,000 on the waiting list.
>
> *Spouses, Minor Children, and Unmarried Adult Children of Permanent Residents (FB-2A and 2B) and Legalization Dependents*. IMMACT increased the family second preference allotment from 70,200, plus any unused first preference numbers, to at least 114,200 visas, plus unused FB-1 numbers. In FY 1994, 115,000 immigrants were admitted in FB-2A and 2B. An additional 34,000 spouses and minor children of

legalization petitioners also entered in FY 1994.

One objective of IMMACT was the reduction in the waiting period for reunifying spouses and children of permanent residents, particularly those from countries with significant backlogs. Prior to IMMACT, applicants from most countries were admitted after about two years. For applicants from a few nations, the waiting period was far longer. The elimination of the per-country limits for a proportion of the FB-2 visas was adopted with the purpose of reducing the waits for such groups. IMMACT accomplished that goal: it equalized the FB-2 waiting time for Mexican, Filipino, and Dominican spouses and children with the worldwide one.

The waiting list for the FB-2 category, however, remains very large and is increasing annually. As of January 1995, it was some 1.6 million, composed largely, but not exclusively, of the spouses and children of legalized aliens. Demand for 2A visas for spouses and children of legalized aliens appears to have peaked, but the relatives of other legal permanent residents are behind them on the waiting list.

Of the FB-2 backlog, more than 1.1 million are in the 2A category, some 850,000 of whom are spouses and children of legalization immigrants. 2A applicants from all countries who have waited about three years are being admitted. While the actual 2A wait for new applicants is not known, it would take at least ten years at the expected FY 1994 usage of 2A visas (about 95,000) to work through the more than one million waiting applicants. The wait may be reduced if large numbers of those who legalized under IRCA naturalize and their spouses and minor children enter under the exempt immediate relative category.

The 2B visas are now available for applicants who have been waiting about four and one-half years. The real wait for a new 2B applicant is estimated at more than fifteen years if the 28,500 limit were reached each year, unless naturalization rates increase significantly. Should the petitioner become a citizen, the 2B beneficiaries would be transferred to the first preference category (unmarried sons and daughters of U.S. citizens), thereby increasing that backlog, particularly for Mexico.

Married Children of U.S. Citizens (FB-3). The annual visa limit was lowered from 27,000 to 23,400 (plus any unused FB-2 visas) by IMMACT, which was about the average for this category in the latter part of the 1980s. In FY 1994, about 22,000 immigrants entered in this preference.

About 250,000 applicants are waiting for a visa in this category. Prior to IMMACT, visas were available for applicants who had waited about one year, with the exception of those from Mexico and the Philippines, where visas were available for those who had waited about eight and nine years, respectively. Visas are now available for those who have waited about two years from most countries. Those from Mexico and the Philippines who have waited about eight and eleven years, respectively, now have visas available to them.

Siblings of U.S. Citizens (FB-4). IMMACT essentially maintained the 65,000 visas in this category (adding any unused FB-3 visas). About 62,000 immigrants were admitted in FY 1994.

There are more than 1.6 million FB-4 registrants. Prior to IMMACT, visas were available for applicants who had waited nine years from most countries; now they are available for those who have waited ten. The longest wait is for those from the Philippines: visas were available for those who had waited fourteen years prior to IMMACT; currently they are available for those who have waited eighteen years. While for certain nationalities the wait continues to grow in this category, the numbers added each year to the backlog are decreasing, perhaps due to the very extensive waiting period. Nevertheless, it is estimated that a new applicant from the Philippines would not reach the top of the list until 43 years after approval of a petition.

Employment-Based Immigration. IMMACT extensively revised the employment-based categories and numbers to emphasize skill and, for the first time, include immigrant investors. Prior to IMMACT, 54,000 visas were available annually for occupation-based immigration, not including the special immigrants now admitted under the employment-based categories. IMMACT allows up to 140,000 employment-based visas to be issued each year to applicants and their spouses and children.

Employment-based immigration rose from an annual average of 58,000 in FY 198791 to 147,000 in FY 1993 (the latter includes unused FY 1992 employment-based numbers) and then fell to 123,000 in FY 1994. These numbers are deceptive, however, since they includes some 27,000 and 21,000, respectively, who adjusted status under the Chinese Student Protection Act [CSPA]. The economic recession may have led employers to petition for fewer immigrant workers than the number possible under the new employment ceilings. Of the 100,000 FY 1994 admissions that actually involved immigrants coming to work and their dependents, about 42,000 were the principal workers.

The employment-based numbers break down as follows:

Priority Workers (EB-1). Approximately 40,040 visas (plus unused EB-4 and EB-5 visas) are available annually for priority workers with extraordinary ability in the sciences, arts, education, business, or athletics and for outstanding professors and researchers and certain multinational executives and managers. Some 21,000 priority workers and their dependents were admitted in FY 1994. Of these, 8,000 were the actual workers, with a majority of these being multinational executives and managers.

Professionals with Advanced Degrees (EB-2). About 40,040 visas (plus unused EB-1 visas) are available annually for professionals with advanced degrees or persons of exceptional ability in the sciences, arts, or business. Some 14,400 EB-2 workers and dependents were admitted in FY 1994; the number of principal workers was about 6,700. FY 1994 numbers appear to be an accurate reflection of current demand (lower than in FY 1992-1993), as both the FYs 1992 and 1993 EB-2 figures included a significant number of pre-IMMACT third preference applicants and their dependents who had been waiting for available visas. Visas are immediately available for EB-2 workers from all countries. Prior to IMMACT, visas were available for professionals and highly-skilled immigrants (former third preference) who had waited about one and one-half years, except for the Philippines, where visas were available for applicants who had waited for sixteen years.

Skilled Workers, Professionals with Baccalaureate Degrees, and Unskilled Workers (EB-3). About 40,040 visas (plus unused EB-2 visas) are available annually to EB-3 applicants. A maximum of 10,000 of these is allotted to unskilled workers. "Unskilled" jobs are considered to be those requiring less than two years of training or experience. Some 77,000 skilled workers, professionals, unskilled workers, and their dependents were admitted in FY 1994. The 77,000 included about 21,000 Chinese Student Protection Act visas. The actual number of skilled workers and professionals was about 18,000; unskilled workers numbered some 4,100.

Prior to IMMACT, visas were available for skilled and unskilled workers (former sixth preference) who had waited about four years, though visas were unavailable at times for applicants from mainland China and India and were available for applicants from the Philippines who had waited about five years. Visas now are available for skilled workers from most countries, though backlogs exist for about 5,000 mainland Chinese and almost 8,000 Filipinos-for Chinese who have waited almost 2 years and for Filipinos who have waited one year.

The only worldwide wait for employment visas now is for unskilled workers, some 79,000 of whom make up the waiting list. Unskilled worker visas now are available for those who have waited five and one-half years, regardless of nationality. Given the large waiting list, if 10,000 unskilled workers were admitted annually, it would take several years to work through the current list. The waiting list total in this category dropped by about 15,000 in the past year, perhaps in part because the long wait for a visa discouraged new applicants.

Special Immigrants (EB-4). IMMACT placed the formerly numerically-exempt category of Special Immigrants in the numerically-limited employment-based categories. The EB-4 category is a catchall for a variety of different groups, including ministers of religion, religious workers other than ministers, certain former U.S. government workers, and certain juvenile court dependents. About 10,400 special immigrants and dependents were admitted in FY 1994. The actual number of principals was about 4,600.

Investors (EB-5). IMMACT created a new category for employment-creating investors and set the limit at

9,940 annually, of which 3,000 are reserved for new commercial enterprises in targeted employment areas. About 600 investors and dependents were admitted in FY 1993 and 444 in FY 1994.

A number of explanations have been offered about why the entry of investors is substantially below the anticipated level. Some experts believe that U.S. tax laws are largely responsible for the relatively small show of interest; unlike some other countries, the U.S. taxes all of an investor's worldwide income if an investor obtains permanent residence. Others have argued that the job-creation requirements of the original law were unrealistic. In 1992, Congress enacted legislation to create a pilot program designed to take into account the indirect creation of jobs. The pilot program began October 1, 1993. So far, no one has been admitted in the EB-4 category under the pilot program. INA provisions offer another reason for low EB-4 admissions: investors enter under a conditional status, and the final rules to remove the conditions were not issued until April 1994. Investors may have been unwilling to begin a process until they knew the conditions they must meet to obtain permanent status.

Diversity Immigration (DV-1). The Diversity Immigrant provisions contained in IMMACT aim to increase national diversity in the immigrant population by widening access to immigration to individuals from underrepresented countries who have neither family nor job ties to the United States. This permanent diversity program began in October 1994. It will provide 55,000 visas to nationals of a country that has sent fewer than 50,000 legal immigrants to the United States over the previous five years. Each applicant must have a high school education or its equivalent or two years of work experience in an occupation that requires at least two years of training or experience. In FY 1995, the numbers are to be apportioned as follows: 20,200 to Africa; 6,850 to Asia; 24,550 to Europe; 8 to North America; 2,600 to South America; and 800 to Oceania. No single country may receive more than 7 percent (3,850) of the numbers available worldwide.

As a transition toward the permanent program, Congress allocated 40,000 visas in each of three years (FYs 1992-1994) for persons from countries "adversely affected" by the 1965 Amendments to the INA, which removed national origins as the principal determinant of U.S. immigration policy. In FY 1994, 41,000 immigrants entered under the transitional diversity visas.

Immigrants outside the Statutory Cap

As the Table shows, some 136,000 immigrants not subject to a numerical cap were admitted to the U.S. in FY 1994.

Refugees. IMMACT made no changes in the refugee admissions program and the Refugee Act of 1980 continues to govern. Prior to the beginning of each fiscal year, the President, in consultation with Congress, reviews the worldwide refugee situation, determines the number of refugees in need of resettlement who are of special humanitarian concern to the U.S., and establishes the authorized number of admissions for that fiscal year. Such refugees are initially admitted under conditional status. In FY 1994, 115,000 of these refugees adjusted to permanent residents.

Asylees. The Refugee Act of 1980 established the statutory basis for granting asylum to refugees who present themselves in the U.S. or at a port of entry, rather than overseas as in the refugee admissions program. There are no legal limits on the number of individuals who may be granted asylum in the U.S. in a fiscal year. Asylees who have been in the U.S. for at least one year after being granted asylum are eligible to become permanent residents. Although asylee adjustments are exempt from the worldwide annual limits, the law places a ceiling on the number of asylees who may adjust to lawful permanent resident status each year. IMMACT increased the ceiling from 5,000 to 10,000, including dependents. Some 12,000 asylees and their dependents became permanent residents in FY 1993. This number included some asylees and their dependents eligible for and awaiting adjustment prior to IMMACT who were permitted to adjust under the new law without being subject to the annual limit. There is no current wait for asylees adjusting status, and some 6,000 asylees and their dependents adjusted in FY 1994.

Parolees. Special provisions have allowed for the entry of Indochinese and Soviets who were paroled into the U.S. between August 15, 1988 and September 30, 1992, after being denied refugee status. These parolees can adjust to permanent resident status one year after their admission to the U.S. The numbers are variable. About 5,000 parolees adjusted status in FY 1991, 14,000 in FY 1992, and 16,000 in FY 1993. About 8,000 parolees adjusted in FY 1994.

Amerasians. Special provisions also have applied in recent years to the entry of Amerasians born in Vietnam between January 1, 1962 and January 1, 1976 and fathered by a U.S. citizen. Eligible Amerasians are issued permanent resident visas for entry. Some 11,000 Amerasians were admitted in FY 1993. These numbers include accompanying family members and guardians. Some 3,000 were admitted in FY 1994.

Other Immigrants. Immigrants can enter under a number of other categories, including categories for Cuban/Haitian entrants, registered nurses, and individuals granted suspension of deportation. (An alien otherwise deportable is eligible to adjust status under the discretionary suspension of deportation if that person has been in the U.S. for at least seven years, is of good moral character, and his deportation would result in extreme hardship.)

Characteristics of Legal Immigrants

IMMACT has not significantly changed the characteristics of the immigrants entering the United States, which is not surprising given the relatively short period IMMACT has been in effect. The categories of immigration revised or added by IMMACT accounted for less than 30 percent of the annual number of immigrants admitted in fiscal year 1992 (employment-based preferences-maximum of 140,000; legalization dependents-maximum of 55,000; and the transitional diversity program-maximum of 40,000). Most immigration continues to be based on family reunification; thus the new immigrant pool primarily reflects the characteristics of the recent immigrant pool and is not likely to change in the immediate future.

The Commission is midway through an analysis of the characteristics of immigrants entering in FY 1994. Our September report provided data on the characteristics of legal immigrants through FY 1993, as gathered by the U.S. Immigration and Naturalization Service. Data on legal admissions are summarized for those who arrived during the 1980s, the two-year period immediately before IMMACT took effect (FYs 1990-1991), and the two-year period after IMMACT took effect (FYs 1992-1993). Aliens granted permanent resident status under the provisions of IRCA are treated separately. Their characteristics are pertinent to understanding future immigration trends because their relatives account for a large share of the family backlog.

Places of Origin. Asia and North America, principally Mexico, continued to be the two largest source regions of legal immigrants, with 41.7 and 30.7 percent of the total immigrants admitted during FYs 1992-1993, respectively. The percentage admitted from these two regions declined slightly from 72.9 in FYs 1990-1991 to 72.4 in 1992-1993. The increases in the overall limits under IMMACT, however, have allowed for increased numbers of immigrants from all the regions of the world. North America and, especially Mexico, had the largest average annual increase between the two two-year periods (68,022 or 36 percent increase), while Oceania had the smallest increase (472 or 11 percent increase).

The countries with the largest increases in the number of immigrants admitted between 1990-1991 and 1992-1993 were primarily countries that were major sources during the 1980s: Mexico; Mainland China; Vietnam; and the Dominican Republic. Other countries had large increases, both in terms of numbers and percent: Poland; El Salvador; the United Kingdom; Ireland; and Japan.

The elimination of the per-country limit for 75 percent of the FB-2A spouses and children of permanent residents allowed for increased immigration from countries with large backlogs, such as Mexico and the Dominican Republic. Mexican immigration also increased due to the temporary category added under IMMACT allowing for the immigration of spouses and children of legalization dependents-nearly three-quarters of all legalization dependents were born in Mexico and El Salvador.

The country with the largest increase in employment-based immigration was Mainland China, which increased from an average of 2,585 a year before IMMACT to 24,800 after IMMACT. More than one-half of the increase was due to the Chinese Student Protection Act, which allowed certain Chinese persons in the United States to adjust status under the EB-3 category. Other countries with a large average annual increase in employment-based immigration after IMMACT were: India; the Philippines; Canada; the United Kingdom; and Taiwan. Immigrants from El Salvador, who previously had been the largest group entering under the old 6th preference, declined an average of 800 over the two, two-year periods, a decline largely due to the reduction in the number of visas available for unskilled workers.

Of the 120,000 transitional diversity visas issued in FYs 1992-1994, 40 percent were legislated to go to natives of Ireland. During the first two years of the program, Ireland accounted for 33.1 percent of the arrivals, second to Poland with 35.9 percent. The number of Irish immigrants entering the United States did not reach 40 percent because of a lack of demand. The transitional diversity program was largely responsible for the significant increases in immigration from these two countries. Other countries accounting for a large number of diversity immigrants during FYs 1992-1993 were the United Kingdom (8.6 percent) and Japan (8.3).

Age and Gender. The median age of immigrants admitted in FY 1992 and FY 1993 was twenty-eight years, no different than immigrants admitted in FYs 1990-1991, and only a slight increase (from twenty-seven) for immigrants admitted during FYs 1982-1989. Even though the median ages did not change significantly between the two-year periods beginning in 1990 and 1992, the data indicate a long-term trend towards a more even distribution of immigrants by age. Although the largest number of entering immigrants are typically in their twenties, recently the percentage of immigrants who enter in their twenties has declined and the percentage of immigrants who enter in their forties and fifties has increased. It is difficult to draw any conclusions from these data on the impact of IMMACT, as the change appears to predate IMMACT. IRCA immigrants were much older than other immigrants at their time of adjustment; however, many have been in the United States for more than ten years and, thus, were younger at the time of their entry.

Nearly 54 percent of the immigrants admitted in FYs 1992 and 1993 were female. By contrast, during the 1980s, men and women were equally represented. The trend toward more women admitted as legal immigrants began prior to IMMACT. It is likely to be reinforced, however, by the entry of the family members of aliens legalized under IRCA. Very high proportions of young adult legalized aliens were men, many of whom already have petitioned for their wives and children.

Intended Residence. Immigration follows much the same pattern as in the 1980s regarding intended residence. Approximately 70 percent of the immigrants intend to live in the six states of California (28.7 percent), New York (17.2), Texas (7.1), Florida (6.5), New Jersey (5.7), and Illinois (4.7). Many immigrants settle in large urban areas; more than 25 percent intend to live either in New York City or Los Angeles. Other metropolitan areas with significant immigrant arrivals are Chicago, Miami, Washington, DC, and San Francisco.

The patterns of residence of the IRCA immigrants is different than other legal immigrants. Although the top six states are the same for IRCA immigrants as for other immigrants, IRCA immigrants are more concentrated. More than 85 percent of IRCA immigrants live in the top six states and more than 50 percent live in California. The family members of the legalized aliens who immigrate in the future should further increase the proportion of legal immigrants residing in California and Texas.

Occupation. The increase in the employment-based preference limit from approximately 54,000 in 1991 to 140,000 in 1992 could have the most impact on the occupational characteristics of new immigrants. Beyond increasing overall admissions, IMMACT reduced the number of unskilled immigrants and their family members from 27,000 to 10,000, while raising the number of highly-skilled immigrants allowed to enter from 27,000 to approximately 110,000.

The reported occupations of immigrants of working age changed only slightly after IMMACT. (All but about 6 percent of adult immigrants report an occupation or report that they are homemakers, students, unemployed, or retired. What is reported may be either their last job in their home country or, if entering under the employment-based preferences or adjusting in the U.S., the job they are or will be performing in the United States.) The percentage of immigrants who reported they were professionals or executives increased from 15.0 percent in the two-year period before IMMACT to 17.0 percent after IMMACT. Every other occupation group declined, except for operators, fabricators, and laborers, which increased from 9.2 to 9.7 percent. The shift in occupational characteristics is consistent for both males and females.

Issues to Be Considered

The Commission is now engaged in a systematic examination of the effects of legal immigration in order to develop interim recommendations this year and longer-term recommendations in our final report to Congress. Among the areas under review are:

Family Reunification. U.S. immigration policy is based mainly on family reunification. The Commission's mandate includes an explicit requirement to assess the impact that the establishment of a national level of immigration has upon the availability and priority of family preference visas, including examination of: the role of family reunification in the integration of new immigrants into U.S. society; the effects of IMMACT on the numbers of individuals admitted for family reunification; the effects of IMMACT on the waiting period for family-sponsored preferences; the effects of different family reunification policies on future demand for visas; the extent to which extended waiting periods for the admission of spouses and children contribute to unlawful immigration; the priority to be given to the admission of individuals of different family ties (that is, spouses, minor children, adult children, siblings); and other issues. The Commission is paying particularly close attention to the effects of legalization on family admissions and backlogs.

Impact on labor needs, employment and other economic conditions in the United States. Both the long and short-term effects of immigration on the labor market need to be understood in formulating sound policy. The evolving international context of the U.S. economy must be a part of this analysis along with the U.S. economic restructuring that has led to more U.S. workers finding different kinds and amounts of employment in service-as opposed to manufacturing-industries. More specifically, the Commission is examining: the characteristics of immigrants and nonimmigrants (hereinafter "migrants") entering the U.S. under different categories as they relate to U.S. labor market considerations-education, skill level, occupation, employment experience, etc.; having entered, their labor force participation rate, employment, wages/income and job mobility experience by different categories of immigration; the impact of migrants in different categories on the labor force participation rate, employment, and earnings of domestic workers (by race, ethnicity, citizenship); the impact of migrants in different categories on the working conditions and benefits of domestic workers; the effects of migrants on specific industries; the extent to which migrants admitted under different employment-based provisions continue to work in the jobs for which they were admitted or in jobs in similar occupations or industries; the type and impact of entrepreneurial activities in which migrants engage; and the impact of various immigrant categories on the generation of jobs for U.S. workers.

The Commission has sought preliminary data on these issues for our interim report. For our final report, we have contracted with the National Academy of Sciences to form an expert panel that will include labor economists, sociologists, demographers, and others concerned with changing labor force and economic effects of immigration.

Social and Civic Incorporation. Immigrants historically have brought to the United States different cultural, religious, and political backgrounds. Over the last few decades, our new immigrant population has shifted from predominantly European to largely Asian and Latin American. Unlike earlier periods of immigration, admissions are not dominated by a small number of countries. At the turn of the century, the top five source countries accounted for 75 percent of new legal arrivals. During the 1990s, the top fifteen countries account for fewer than 70 percent. These top sending countries include such diverse nations (in terms of economic status, political systems, religious backgrounds, and racial makeup) as Mexico, China, Philippines, Vietnam, the former Soviet Union, and the United Kingdom. The Commission inquires about the effects of our immigrant population on social and community relations, as well as the effects of American life on immigrants. Further the Commission is looking at the civic integration of immigrants, including participation in local, state, and national political affairs, development of political constituencies, and other manifestations of civic involvement. The Commission plans to issue recommendations on naturalization as part of its interim report in June.

Refugee and Humanitarian Issues. There are well over 20 million refugees and at least another 25 million internally-displaced people who have fled from violence and persecution but have not crossed an international border. The U.S. plays an important role in refugee affairs as the principal donor to international refugee programs, a principal supporter of durable solutions to refugee crises, and a major receiver of refugees for resettlement. The Refugee Act of 1980 adopted the international definition of refugees, rejecting the earlier U.S. definition that specified that refugees were individuals fleeing Communist countries. Yet, refugees from (former) communist countries continue to account for the vast majority of those admitted to the U.S. as refugees. The Commission is examining questions about: what role refugee resettlement should play in the post-Cold War era; what factors should replace Cold War criteria in deciding who should be given priority for resettlement; and what size program makes sense in light of these changing standards and of the continued numbers of refugees in need of the assistance and protection that the U.S. has traditionally provided. The Commission is examining these issues in conjunction with its analyses of the U.S. capacity to respond to migration emergencies headed directly for the United States.

CIR Activities Related to Legal Immigration Reform

To date, the Commission has held expert consultations on family-based admissions, employment-based admissions, refugee resettlement and other humanitarian admissions, and the demographic effects of immigration policy. We have held field hearings and consultations on legal immigration policy in: Chicago, Illinois, with a particular focus on naturalization; Lowell, Massachusetts, looking especially at the effects of immigration on a small city; New York, New York, with its heterogeneous immigrant population; Central Texas, with particular focus on immigration in high-tech industries; and Phoenix, Arizona, with a particular focus on land use and other effects of increased population.

The Commission continues to undertake research aimed at clarifying the effects of legal immigration on U.S. society and economy. We have testified to you previously that the Commission is not satisfied with the reliability of immigration data. As noted above, the Commission is working with the National Academy of Sciences to establish an expert panel that will present its conclusions on the demographic, labor market, fiscal, and other economic effects of immigration. The panel will include a wide range of expertise not only on the literature directly related to the effects of immigration, but also on the various areas in which immigration's impact is felt, so that we can get beyond disputes about data that ought to be matters of fact.

The Commissioners have engaged in extensive discussions about the national interests to be served by immigration, the extent to which current policies serve these national interests, the extent to which immigration benefits or harms the already-resident U.S. population, and the advantages and disadvantages of various options to correct problems identified through this process. As in the Commission's 1994 report to Congress, the aim of this year's recommendations is to suggest ways that U.S. immigration policy may best meet high standards of credibility in its formulation and its implementation.

As I stated at the outset of this testimony, Professor Jordan looks forward to sharing the Commission's recommendations with you next month. In the meantime, I would be pleased to answer questions you may have about the data presented in our 1994 report or our activities in preparation for our forthcoming recommendations.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan
Chair, U.S. Commission on Immigration Reform
Before a Joint U.S. House of Representatives Committee on the Judiciary
Subcommittee on Immigration and Claims
and
U.S. Senate Committee on the Judiciary
Subcommittee on Immigration
June 28, 1995

Thank you for providing this opportunity to present the Commission on Immigration Reform's interim recommendations on legal immigration reform. This Commission was mandated by the Immigration Act of 1990 to examine and make recommendations regarding the implementation and impact of U.S. immigration policy.

In fulfilling this mandate, the Commission has held public hearings and consultations in Los Angeles, Miami, El Paso, Chicago, Lowell, New York, Austin, San Juan, and Phoenix. During the site visits, the Commission visited service agencies, community groups, and others with interest in immigration. We met with university-based researchers in these areas in order to be better informed of the cutting-edge research available on the local effects of immigration.

The Commissioners also held expert consultations on the national-level labor market impacts of immigration, the demographic effects, and the fiscal impacts on federal, state, and local programs. In addition, we held public meetings on the various parts of our legal immigration system, with separate sessions with practitioners familiar with family-based immigration, employment-based immigration, and refugee admissions. We undertook systematic analysis of the available research on such topics as the economic and social characteristics of recent immigrants, the impact of immigration on federal, state, and local benefit programs, the economic adaptation of immigrants, and the demographic and environmental effects of immigration. The Commission also commissioned research that modeled likely future demand for immigrant admissions. This research continues in preparation for our final report to Congress in 1997, but our work to date provides useful perspectives for interim recommendations.

Foremost, the Commission concludes that a properly regulated system of legal immigration is in the national interest of the United States. Such a system enhances the benefits of immigration while protecting against potential harms.

Immigrants often create new businesses and other employment-generating activities and, in this manner, promote the renewal of city neighborhoods and commercial districts. Immigrants also can strengthen America's economic and political ties with other nations and, thereby, enhance our ability to compete in a global economy and provide leadership in international and humanitarian affairs. Properly regulated immigration further strengthens American scientific, literary, artistic, and other cultural resources. It promotes family values and ties that are important components of good schools and strong communities. At a time of troubling ethnic strife in many parts of the world, an effective American immigration policy can demonstrate to other countries that religious and ethnic diversity are compatible with national civic unity in a democratic and free society.

Legal immigration, however, has costs, as well as benefits. Immigrants with relatively low education and skills may compete for jobs and public services with the most vulnerable of Americans, particularly those who are unemployed or underemployed. Jobs generated by immigrant businesses do not always address this problem. Concentrated and/or rapid entry of immigrants into a locality may impose immediate net costs, particularly in education, where expenditures are required to meet the additional and special needs of newcomers. Concentration of new immigrants can exacerbate tensions among ethnic groups. Certain legal immigrant populations may impose other costs: refugees often have special needs for health and other services, making resettlement significantly more costly than overseas solutions to refugee problems; elderly new immigrants are more likely to draw upon public services than elderly native-born Americans or

immigrants who came to the United States at a younger age.

The Commission supports the basic framework of current immigration policy-family unification, employment-based immigration, and refugee admissions. We considered alternative frameworks, particularly a point system, but rejected these approaches. We believe that a system that relies on formulas and bureaucratic procedures for determining which immigrants meet the formula is not as effective in protecting the national interest as one that relies on the judgment of American families and employers within a framework that protects U.S. workers from unfair competition.

At the same time, the Commission is convinced that our current immigration system must undergo major reform to ensure that admissions continue to serve our national interests. Hence, the Commission recommends a significant redefinition of priorities and a reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration system.

In developing our recommendations, the Commission was guided by the following principles:

1) Clear goals and priorities must define our immigration policy;

2) Effective policy means enforcement of immigration limits;

3) Regular periodic review is needed to ensure flexibility to adjust to changing circumstances in the United States;

4) Immigration policy should be comprehensible and its implementation efficient;

5) Sponsors are responsible for ensuring that immigrants do not become burdens on the American taxpayer;

6) Immigration policy must protect U.S. workers against unfair competition from foreign workers, with an appropriately higher level of protection to the most vulnerable in our society;

7) Both temporary and permanent admissions categories must be seen as integral parts of a cohesive immigration policy;

8) A sound immigration policy supports Americanization, by which we mean the sharing of such American values as the belief in liberty, democracy, and equal opportunity;

9) Fundamental immigration reform, as proposed by the Commission, requires a period of transition to get from the present system to the new one.

Following these principles:

The Commission recommends a tripartite immigration policy that permits the entry of nuclear family members, professional and skilled workers, and refugees, with additional steps to address the continued aftereffects of the 1986 Immigration Reform and Control Act that provided legal status to formerly illegal aliens. We propose a core immigration admissions level of 550,000 per year, to be divided as follows:

Nuclear family immigration	400,000
Skill-based immigration	100,000
Refugees	50,000

The Commission further recommends that Congress authorize 150,000 visas annually for the admission of the spouses and minor children of legal permanent residents who have been awaiting entry until such time that the backlog is eliminated.

The Commission recommends that admission levels be authorized by Congress for a specified time period (e.g., three to five years) in order to ensure regular periodic review and, if needed, change by Congress.

More specifically, the Commission recommends changes in the components of U.S. immigration policy, including family-based immigration, skills-based immigration, and refugee resettlement. The Commission also addresses issues related to Americanization of new immigrants, with a particular focus on naturalization.

Nuclear Family Immigration

Immigration supports the national interest by promoting strong and intact nuclear families-that is, the basic social unit consisting of parents and their dependent children living in one household. Immigration contributes to this national interest by permitting the entry of close family members of U.S. citizens and permanent residents who otherwise may be separated for years. Immigration policy also can contribute to the strength of U.S. families by ensuring that immigrants receive any needed financial support from their own relatives and, thus, impose no financial burdens upon the taxpaying public.

The Commission recommends:

A prioritization of family relationships to determine who will be admitted through family-based immigration, with admission numbers going to those who are of the highest priority. Only to the extent that visas are available after the demand in higher priorities is met should visas be made available to lower priority categories. Following this reasoning, the Commission makes further recommendations.

- Spouses and minor children of U.S. citizens should continue to be admitted as the first priority. Also to be admitted under this priority are the small number of adult children dependent on U.S. citizen parents because of a mental or physical disability. This policy permits the expeditious entry of the closest family members while reinforcing the notion that citizenship confers additional benefits on those who become fully participating members of our polity.

- Parents of U.S. citizens should be admitted as the second priority. However, the Commission is mindful of the potential negative impacts that the entry of parents may pose for the U.S. taxpayer if these individuals utilize Supplemental Security Income, Medicaid, and similar programs. Therefore, the Commission believes that continued admission of parents should be contingent on a legally-enforceable affidavit of support. The affidavit should ensure that parents who are unable to work enough quarters to become eligible for Social Security or Medicare do not become a burden to taxpayers through use of SSI, Medicaid, or equivalent state and local services. Further, the Commission recommends that affidavit signers (petitioners and/or coguarantors) should provide: verifiable assurance that they indeed have the capacity to provide what may be a lifetime of financial support to the parent immigrants; and verifiable assurance of the purchase of what may be lifetime health coverage for the parent immigrants (obtained either privately or through buying into Medicare, which the government should make available at an actuarially fair price).

- Third priority should be allocated to spouses, minor children, and adult dependent children (as above) of legal permanent residents [LPRs].

The Commission further recommends sufficient additional numbers, on an interim basis, to eliminate the backlog in the category for admission of spouses and minor children of LPRs. We believe that this backlog, which results primarily from the Immigration Reform and Control Act, can be cleared without creating another waiting list. By the end of this fiscal year, 824,000 spouses and minor children of aliens legalized under IRCA will be waiting for visas. The number of new applications has fallen to only a handful for this group. However, since the filing of applications by the legalization beneficiaries, a backlog of 279,000 (or about 80,000 per year) spouses and minor children of other LPRs has developed. Under our current system, it would take more than a decade to clear the backlog, even with substantial naturalization. In the meantime, when an LPR sponsors a spouse and/or minor child, that individual goes to the end of the waiting list of 1.1 million.

Priority for clearance of the backlog should go first to the spouses and minor children of LPRs who themselves entered lawfully under the regular immigration preferences. Only afterwards should expedited admission be offered to the

spouses and minor children of LPRs who entered under one of the legalization provisions of the Immigration Reform and Control Act.

The Commission recommends this separate treatment of the family members of those who became permanent residents through regular immigration and those who legalized under the IRCA because:

- The circumstances are different for the two sets of spouses and minor children. Many of the families of the immigrants who legalized under IRCA are in the United States and, under the Family Unity provisions of the Immigration Act of 1990, have a quasi-legal status that permits their continued presence and work authorization. Many of the families of the other legal immigrants are separated, with their spouses and/or minor child(ren) living outside of the United States.

- As of December 31, 1995, most legalized aliens will be eligible to naturalize. As citizens, they will be able to expedite the admission of their spouses and minor children without the additional visas earmarked for LPRs.

- The legalized already have received special treatment in obtaining amnesty. To further reward their earlier illegal entry by giving equal or higher priority to the entry of their relatives sends the wrong message at a time in which the U.S. must obtain greater control over unauthorized entry.

The addition of 150,000 visas will permit the elimination of the regular LPR beneficiary backlog within three years and the legalization beneficiary backlog in five to eight years. Thereafter, the entry of all spouses and minor children of LPRs should be possible within a year of application under the proposed 400,000 admissions ceiling on family-based immigration.

The Commission recommends elimination of other family-based admission categories, including:

Adult, unmarried sons and daughters of U.S. citizens;

Adult, married sons and daughters of U.S. citizens;

Adult unmarried sons and daughters of legal permanent residents, and;

Siblings of U.S. citizens.

The Commission acknowledges that many individuals in these categories have contributed to U.S. society. Nevertheless, it is necessary at this time to emphasize the reunification of nuclear families. The elimination of these categories should take place one year after the date that legislation is enacted to accomplish this purpose. In this way, the plans of U.S. families that are on the verge of reunifying with their foreign siblings and adult children will not be unfairly disrupted. The Commission recommends elimination of these categories for several reasons.

- The numbers now used to admit these individuals in more extended family relationships could be used instead to reduce the waiting time for closer family members without raising the overall levels of immigration.

- Elimination of these preferences will remove extraordinary backlogs that now undermine the credibility of our policy. Credible immigration policy should not give false hopes to applicants. An individual now applying under the sibling category, for example, could not expect to enter the U.S. legally for more than a decade.

- Unless there is a compelling national interest to do otherwise, immigrants should be chosen on the basis of the skills they contribute to the U.S. economy. The Commission believes that admission of nuclear family members and refugees provide such a compelling national interest, even if they are low-skilled. Reunification of adult children and siblings of adult citizens solely because of their family relationship is not as compelling.

The Commission recommends amendment of Section 201(c) of the Immigration and Naturalization Act [INA] to provide that otherwise unused immigrant visa numbers for a fiscal year be made available to people who have a priority date that would entitle them to processing in that year but who were not issued visas. Given the large

backlog of spouses and minor children, all efforts should be made to ensure their expeditious entry by fully utilizing authorized visas. Under current policy, visas unused because of administrative delay or personal reasons are lost. Allowing such unused visas to be made available to otherwise eligible immigrants after the end of that fiscal year ensures that all the visas allocated for family-sponsored immigrants would be used and charged to the given fiscal year. The new fiscal year visa numbers would not reflect an increase in visas allocated over the annual worldwide limit for family-based immigration.

For example, if 400,000 visas were allocated for family-sponsored immigrant in FY 1997, and during that year only 390,000 visas were issued because 10,000 immigrants were delayed beyond the end of the fiscal year, the remaining 10,000 visas could be issued to the delayed or other eligible aliens during the next fiscal year but would count toward the original year. Under the proposed amendment, the Department of State could charge to FY 1997 all visas allocated in that year even though the visas themselves might not be issued in FY 1997. As the recommendation affects only aliens already entitled to a visa, annual number limitations would not be exceeded.

The Commission further recommends that the INA be amended to address better the aging-out problem of certain aliens. One unfortunate side effect of waiting lists is the aging-out of aliens while awaiting their already approved petition. This issue, which arises particularly in the case of the minor children of legal permanent residents, will become even more of a problem with the elimination of admission opportunities for adult children. For example, the minor child of a legalized alien may have been granted Family Unity status with the understanding that eventually a visa would be available. Under current law, a child who has aged-out would rarely be deported but is no longer eligible for permanent residence as a minor child. A provision stating that a person entitled to status at the time a petition is approved shall continue to be entitled to that status, regardless of his or her age, would allow such applicants to retain their eligibility for immigrant visas.

Skill-Based Immigration

Immigration can support the national interest by bringing to the U.S. individuals whose skills would benefit our society. It also can help U.S. businesses compete in the global economy. This national interest in the competitiveness of business must be balanced by an equally compelling national interest in developing a U.S. workforce that has the skills necessary to compete in the global economy. Immigration policy can contribute to this national interest by:

- Focusing on the admission of highly-skilled individuals;
- Giving employers access to a global labor market when they cannot identify U.S. workers with knowledge and expertise required for a specific job or when they demonstrate a labor shortage that cannot be filled through short-term training programs;
- Helping companies conducting business, both in the United States and internationally, reassign personnel as needed to maintain their competitiveness;
- Encouraging entrepreneurial activities and other investment in the United States aimed at creation of jobs;
- Providing a means of ensuring that U.S. workers are not displaced or otherwise adversely affected by the entry of foreign workers; and
- Providing incentives or penalties to help ensure that employers in the U.S. engage in serious recruitment of American workers (for example, national rather than local recruitment where appropriate) and contribute significantly to the training of the domestic U.S. workforce.

  The Commission recommends that the preferences for the admission of skill-based immigrants be reorganized to establish two categories: those subject to a labor market test, which we would expect to be the norm; and those who, for significant and specific policy reasons, should be exempt from such a labor market test. Labor market-testing requires a demonstration that a business has a bona fide need for the skills of a foreign worker and cannot find a qualified U.S. worker or one who could be readily trained for the intended job.

  Exempt workers should include those individuals whose entry will generate economic growth and who hold no potential for undermining the employment prospects and remuneration of U.S. workers. The following individuals should be exempt:

- Individuals at the very top of their chosen field whose extraordinary ability in the sciences, arts, education, business, and athletics is demonstrated by sustained national or international acclaim and whose achievements have been recognized through extensive documentation, or individuals who have demonstrated the potential for extraordinary achievement in their chosen field through extensive documentation, including receipt of international prizes and the testimony of appropriate experts;
- Managers and executives of international businesses. Greater safeguards must be put in place to ensure that only bona fide international businesses benefit from this policy;
- Entrepreneurs whose active investment in new commercial enterprises generate a significant number of jobs for American workers in the United States;
- A limited number of individuals ordained by a religious denomination and other religious workers who have carried on the religious vocation abroad during the two years immediately preceding the application for admission and who are members of a religious denomination having a bona fide nonprofit, religious organization in the United States that sponsors them.

Labor market-tested foreign workers permitted to immigrate to the United States under these categories should include only those who have attained a baccalaureate or higher academic degree or those who are needed to fill jobs that require a high level of specific skills above the entry or journeyman level. Categories that would require a test of the domestic labor market include:

- Professionals with advanced degrees, including professors and researchers who do not meet the definition of "extraordinary;"
- Professionals with baccalaureate degrees and skilled workers with a minimum of five years of specialized work experience, whose admission should be scrutinized strictly to ensure that they will have no adverse effect on similarly qualified U.S. workers.

The Commission recommends the elimination of the admission of unskilled workers. Unless there is another compelling interest, such as in the entry of nuclear families and refugees, it is not in the national interest to admit unskilled workers, especially when the U.S. economy is showing difficulty in absorbing disadvantaged workers and efforts towards welfare reform indicate that many unskilled Americans will be entering the labor force.

The Commission is not satisfied with current labor certification procedures because they are neither timely enough to meet the needs of employers with a bona fide interest in hiring a foreign worker nor effective in protecting the interests of U.S. workers. We seek to replace a failed and expensive regulatory system with one that is market-driven. (The cost to the federal government was about $70 million in 1992.)

The Commission recommends replacing the labor certification procedure with the following more timely and effective labor market test:

n To demonstrate the bona fide need for a foreign worker and to increase competitiveness of U.S. workers, an employer should be required to pay a substantial fee, that is, make a substantial financial investment into a certified private sector initiative dedicated to increasing the competitiveness of U.S. workers, for example through education and training. Employers seeking to hire foreign workers already incur substantial financial costs and face lengthy processing delays. Under the Commission's proposal, the fee would go towards developing a well-trained U.S. workforce rather than supporting costly bureaucratic processes. To ensure that the employer, and not the foreign worker, pays the fee, penalties should be imposed upon violators.

- Employers should demonstrate that they have engaged in appropriate attempts to find a qualified U.S. worker using normal company recruitment procedures that meet industry-wide standards and offering wages that are at least 5 percent above the prevailing wage.

- The resulting permanent resident status so obtained should be conditional for a two-year period. Conditional status would be removed at the end of that period if the foreign worker is still employed by the same employer at the same or higher level and if the employer demonstrates that the attested wage has been paid. The law should specify conditions under which the foreign worker could obtain a waiver of the two-year requirement. For example, it could be waived in situations where unanticipated circumstances, such as

layoffs or business failure occur or where an employer's unfair labor practices would render the foreign worker subject to abuse. To prevent both fraud and abuse against workers, penalties should be authorized.

To provide greater flexibility and allow for market adjustments, the Commission recommends that skill-based visas not used in a fiscal year be carried over to the next year's skill-based numbers. In this way, skill-based visas unused during a downturn in the economy would be readily available if business improves and there is greater need for skilled foreign workers.

Refugee Resettlement

The Commission strongly affirms that the United States should continue its commitment to resettle refugees as one of several elements of humanitarian protection for the persecuted. Refugee admissions fulfill a humanitarian commitment to provide protection and assistance to those who otherwise would be persecuted or endangered. The Commission recommends that, on an interim basis:

- The U.S. should allocate 50,000 admission numbers each year to the entry of refugees from overseas;
- Other than in emergency situations, any refugee admissions in excess of the 50,000 admission level could occur only with more active participation by Congress than occurs in the current consultation process;
- In the case of an emergency, the President may authorize the admission of additional refugees upon certification of the emergency circumstances necessitating such action. The Congress may prevent the emergency admissions only with a two-house veto of the Presidential action.

Allocating a set number of refugee admissions, with provisions to exceed this number in case of an emergency or other changed circumstances, ensures a continued U.S. commitment to resettlement, particularly following the expected closure of the current refugee programs in Southeast Asia and, possibly, the former Soviet Union. These two programs account for almost 80 percent of current resettlement (about 87,000 out of 112,000 admissions in FY 1994).

Reform of the current consultation process is needed to ensure Congressional oversight of decisions made to exceed the 50,000 limit. Current consultations are often pro forma and occur very late in the planning process. As discussed below, the Commission will provide recommendations on mechanisms for decisionmaking on numbers in a forthcoming report.

The U.S. should take leadership in generating international responses to refugee crises, with particular focus on international burdensharing and regional solutions. Future policies also must take into account the relative weight to be given resettlement versus the other avenues open to the United States to help protect and assist refugees worldwide, including support for repatriation of refugees to their homelands when conditions permit.

The Commission recommends a thorough assessment of the criteria used to admit refugees for resettlement and the procedures for their admission. The contexts for making future policy regarding refugee resettlement are in flux. The refugee resettlement program must be revamped to meet the needs of a post-Cold War world, in which extreme nationalism and ethnic conflicts continue to produce massive population displacements while resolution of other conflicts is permitting large-scale voluntary repatriation. Resettlement criteria should take into account the protection of refugees who otherwise would be endangered in a country of origin or asylum and who would have no other alternatives.

The Commission is reviewing a variety of issues related to refugee resettlement, including: the priority system; in-country refugee processing; country-specific legislation; procedural issues; Congressional and Executive branch roles, including the consultation process; the role of international organizations; parole authority; and domestic assistance, including the role of the state and local organizations (e.g., nongovernmental organizations and voluntary agencies).

The Commission also is engaged in a thorough review of issues related to immigration emergencies. Specific

recommendations on this subject-which may include modification of the above interim recommendations on refugee resettlement-will be included in a Commission report planned for the end of 1995.

Nonimmigrant Admissions

The Commission believes that both permanent and temporary (nonimmigrant) admissions must be considered as part of an integrated immigration system. Although we are deferring specific recommendations on most nonimmigrant issues until we have completed a comprehensive review, we do note two areas of particular interest.

Temporary Workers and Foreign Students. **The Commission intends to examine in depth the nonimmigrant temporary worker and foreign student systems and their relationships to permanent immigration**. In particular, we will be looking at ways to simplify and achieve greater coordination in these systems and to make recommendations as a result of this study. A high percentage of applicants for permanent skill-based admission are already in this country on temporary work or student visas. Businesses that intend to petition for permanent visas for new hires frequently obtain temporary visas first because of long delays in processing. In addition, a significant number of individuals admitted for temporary study or work seek permanent jobs during their stay. As noted above, these categories of temporary admission must be seen as integral parts of a coherent legal immigration policy. The Commission will address these specific issues in a later report.

Agriculture Guestworker Program. **The Commission believes that an agriculture guestworker program, sometimes referred to as a revisiting of the "bracero agreement," is not in the national interest and unanimously and strongly agrees that such a program would be a grievous mistake**.

First, the Commission is highly skeptical of the need for an agricultural guestworker program at this time or in the near future. Proponents of such a program have failed to demonstrate that a labor shortage is about to occur or that there are no means other than a guestworker program available to agricultural producers to obtain sufficient employees in their industry.

Guestworker programs effectively expand rural poverty. Moreover, guestworker programs are predicated on limitations on the freedom of those who are invited to enter and work. Experience has shown that such limitations are incompatible with the values of democratic societies. For that very reason, "temporary" guestworkers tend to become permanent residents, de facto or even de jure. The ongoing inconsistency between the stated intent of a guestworker program and the actual consequences cannot be ignored by policymakers who seek credibility in a reformed system.

Americanization

The United States is one of the most successful multiethnic nations in history. It has united immigrants and their descendants from all over the world around a commitment to democratic ideals and constitutional principles. Those ideals and principles have been embraced by persons from an extraordinary variety of religious and ethnic backgrounds, partly because they permit and protect religious and cultural diversity within a framework of national political unity.

Cultural and religious diversity does not pose a threat to the national interest as long as public policies ensure civic unity. Such policies should help newcomers learn to speak, read, and write English effectively. They should strengthen civic education in the teaching of American history for all Americans. They should lead to the vigorous enforcement of laws against hate crimes and of laws to deter and to punish discrimination. Of course, such policies should encourage the naturalization of immigrants as the path to full civic participation.

At the same time, immigration to the United States should be understood as a privilege, not a right. Immigration carries with it obligations to embrace the common core of the American civic culture, to seek to become able to communicate-to the extent possible-in English with other citizens and residents, and to adapt to fundamental constitutional principles and democratic institutions.

In its further deliberations, the Commission will consider other public policies that are believed by some to encourage ethnocentrism in the name of multiculturalism or to promote political separatism in the name of civil rights. It will review whether bilingual education and affirmative action as applied to immigrants and their children promote, rather than detract from, civic unity. Now that immigrants come from more than 160 nations and many more ethnic groups, it is extremely important that public policies facilitate, not inhibit, the Americanization of newcomers.

Naturalization is the most visible manifestation of civic incorporation. At present, there is greater interest in naturalization than there is a capacity to act upon this interest. Large backlogs must be overcome so that the nation can benefit from the growing commitment of immigrants to become American citizens.

The Commission strongly recommends that INS adopt and implement as a strategic goal the reduction of processing time and backlogs for naturalization while maintaining rigorous standards in processing applications. The Commission also urges Congress to appropriate sufficient resources to support the implementation of this strategic goal. Applicants for naturalization pay a fee designed to cover the costs of the application process. The fees go into an account dedicated to use for examinations. The Commission believes that naturalization applicants have the right to receive the timely service that their fee represents. Naturalization fees should not subsidize other activities. Nor should an efficient naturalization procedure require a reallocation of resources from other priority functions. If the current fee is not adequate to cover the full costs of timely naturalization, it should be increased appropriately.

Further, the Commission urges INS to:

- Set a standard reasonable time frame for processing naturalization applications. The time frame should permit timely review of applications without lowering the standards for civics and English language knowledge or compromising the required background checks. The INS also should improve process and policies, as well as allocation of resources, to establish a level of efficiency that can withstand fluctuations in volume.
- Continue to recruit national and community-based organizations, both public and private, as well as employers, to assist in facilitating smooth operation of the processing of naturalization applications. These organizations have proved very helpful in prior partnerships with INS in: overseeing proper completion of applications; taking security check fingerprints; serving as testing sites for the required English and civics examinations; briefing applicants on procedures; providing less intimidating final interview sites; and reviewing files before interviews to make certain that examiners need spend time only on substantive interview issues.
- Ensure that there are adequate numbers of personnel to complete naturalization processing efficiently. To reduce waiting periods in districts with backlogs, INS should reassign personnel and, where appropriate, designate examiners who will do naturalization interviews exclusively. In instances where an interview can be waived, INS should permit naturalization applications to be filed, reviewed, and approved at one of its four regional service centers
- Carefully scrutinize the naturalization applications of all Special Agricultural Workers [SAW] to assure their original SAW status was properly granted. Reports of widespread fraud in this program require such special attention to applications for U.S. citizenship by SAW legalization beneficiaries.

The Commission urges both the public and private sectors to assist legal immigrants in their preparation for naturalization. The Commission urges private industry, churches, community groups, and individual volunteers to redouble their efforts to provide English language instruction and civics education to immigrants. The current increased interest in naturalization presents an opportunity to use instruction in English, U.S. history, and civics to help immigrants participate more fully in the life of the community. Private sector initiatives would fill current gaps in such services. These programs also would benefit the providers, particularly businesses, who would gain from a workforce better able to communicate in English.

The Commission supports targeted outreach programs aimed at informing eligible immigrants about the requirements for naturalization. Outreach programs are critical to civic incorporation. They encourage immigrants

to want to become citizens and help ensure awareness of opportunity and equitable access to information about naturalization.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Richard M. Estrada
Commissioner, U.S. Commission on Immigration Reform
Before the U.S. House of Representatives
Committee on the Judiciary
Subcommittee on Immigration and Claims
December 7, 1995

Agricultural Guestworker Programs

Mr. Chairman:

The following points represent a summary of my formal written testimony:

- Reviving or expanding agricultural guestworker programs would fly in the face of evidence of high employment in the agricultural labor sector;
- The external costs of foreign agricultural labor, including social service costs, represent a taxpayer-funded labor subsidy to employers;
- Agricultural guestworker programs have few or no protections for guestworkers;
- Agricultural guestworker programs are labeled "temporary" but contain no mechanisms to ensure the return of guestworkers;
- Agricultural guestworker programs have historically promoted illegal immigration instead of reducing it;
- Reviving or expanding agricultural guestworker programs is risky in the context of current external costs, such as social services, and the likelihood that such costs will increase at the local and state level in the context of devolution.

In the face of such evidence my testimony concludes that reviving or expanding agricultural guestworker programs is not in the national interest of the United States.

Mr. Chairman, thank you kindly for the opportunity to testify before you today. I am honored to have been invited. My name is Richard M. Estrada. I am a native of New Mexico, currently based in Dallas, Texas.

I hold the title of associate editor of the editorial page of *The Dallas Morning New*s. I am also a columnist under contract to *The Washington Post* Writers Group. In addition, I am a member of the U.S. Commission on Immigration Reform, a nine-member bipartisan panel appointed by Congress. A political independent, I happen to have been appointed by the Senate Republican leadership.

Also for the record, I would like to note that in 1986 and 1987 I worked for the Center for Immigration Studies and the Federation for American Immigration Reform. The following testimony is based on years of personal interest in and professional investigation into the issue.

My most recent fact-finding trip occurred last month when I traveled to the state where the question of foreign agricultural labor is most prominent, California. There I met with some of those who most fervently support, as well as those who most fervently oppose, the revival or expansion of agricultural guestworker programs. I sincerely hope the

facts and viewpoints I present here today will be of some use to you and your colleagues as you craft immigration-related policy in this area.

The Commission on Immigration Reform has already strongly recommended against the revival of an agricultural guestworker program, such as the one that occurred under the terms of the so-called Bracero Agreement in effect from 1942 to December 31, 1964.

The internal deliberations of the Commission have not always been studies in harmony. But it may interest you to know that on no issue has there been greater agreement than on this one. Simply stated, the Commission, which substantially represents a very broad spectrum of views and opinions on immigration, does not consider a revived agricultural guestworker program to be in the national interest. If I may, I would now like to give you my reasons as to why this is so.

Free vs. Unfree Labor

I oppose new or expanded agricultural guestworker programs because they represent "unfree" labor.

Doubtless, some will immediately object to the use of this term because all the workers in question would presumably come to America willingly. Despite uncertainty about the circumstances under which guest laborers in such programs are selected, let us concede for the sake of argument that all guestworkers do in fact come willingly.

One must still insist that the absence of slavery does not imply the presence of freedom. As commonly understood, the term free labor also implies that an individual can sell his or her labor on the open market to whomever will contract for it. It is in this regard that guestworker programs are, by definition, unfree labor arrangements or, at the very least, not totally free labor arrangements.

To be specific, the agricultural guestworker is explicitly obligated not to sell his or her labor anywhere else but to the agricultural employer who sponsors entry. Employers tend to prize guestworkers for their abilities, true. But they also value them because they have no options and are, therefore, more malleable. (Employers tend to prefer the term "disciplined.")

This basic characteristic is the ugly underbelly of any and all agricultural guestworker programs: the foreign worker is virtually indentured to the agricultural employer, with an important exception. Unlike indentured servitude as practiced in America in the eighteenth century, the guestworker has no expectation based in the legal provisions of his or her entry that he or she will be able to become a free laborer in America.

In addition, guestworker programs tend to have no worker protections. When it come to housing and health care, uneducated and often illiterate guestworkers, who often do not speak English and who have little or no disposable income, are left to fend for themselves. There are thousands of such people roaming the agriculture-based communities of America today. Reasonable and honorable people may disagree about guestworker programs in general, but the specific practice of providing no meaningful worker protections in this manner is unacceptable. It is wrong. It is immoral.

Finally, Congress should consider that the "Bracero" guestworker program was implemented in 1942 under extremely unusual conditions. With millions of native-born rural workers suddenly called off to war, turning to foreign labor through a temporary guestworker program was justified. Even so, the fact that it took more than twenty years to end the Bracero program, long after the end of the Second World War, should give Congress pause about reintroducing it. Cheap, unskilled foreign labor has proven to be an opiate to agricultural employers. Congress should dispense it sparingly, if at all.

"Needs" of Growers and Consumers

A serious analysis of the agricultural guestworker issue must of course weigh the arguments of those who are lobbying for an expansion in the supply of agricultural guestworkers. In particular, fruit and vegetable growers routinely maintain that a sizable and replenishable foreign agricultural labor supply is imperative, not only for their own economic survival,

but also for the benefit of the American consumer at large.

In promoting their demands, growers routinely raise worst-case scenarios. They invoke the specter of produce rotting in the fields as a direct result of an insufficient labor supply. They also allege that, absent whatever levels of foreign labor they may demand at any given time, consumers will be obligated to pay sky-high prices for their fruits and vegetables.

Such arguments possess elements of truth. Common sense says that having too few workers may indeed result in an inability to pick an entire crop, especially within the limited window of opportunity that some, but not all, growers have. And, should the crop yield be insufficient to meet consumer demand, the most basic law of economics says that the greater the demand, the greater the price of the produce will tend to be.

Still, these arguments must be placed in context. The first thing to note about them is their absolute or extreme nature. Virtually no one other than agricultural employers is implying that any labor shortage at all is occurring or is about to occur. Anyone who reviews the historical record will find that allegations of actual or impending labor shortages have been common in this debate but that actual labor shortages have been rare.

Consider the unfounded scare about shortages of apple pickers in Washington state in 1987 or the enormous oversupply of labor that obtains in California normally, as proved by unemployment figures in agricultural regions of the state.

I recently heard testimony from growers in Fresno about what they termed a very serious labor shortage in the early fall of 1990. However, a review of economic data pertaining to the raisin industry at the time found that at the height of the alleged shortage, they offered a piece rate increase of a few pennies, at best. This during a time in which the value of the California raisin industry was in dramatic ascent.

Indeed, one often gets the feeling that when growers say they can't find workers, they fail to complete the sentence. What they really mean is that they can't find workers at the extremely low wages and working conditions they offer.

Aside from wages and working conditions, Congress would be well advised to study the issue of living conditions. In many cases, agricultural employers are hiring workers who live in the worst conditions imaginable. Lest anyone think I am exaggerating, consider the case of Mexican agricultural workers in northern San Diego County, California. For years, this region has seen agricultural workers literally live in holes in the ground that have been lined with plastic. These are popularly called "spider holes."

Around Fresno, to the north, they have been known to live in cars or in the most primitive tin and cardboard shacks. This represents no improvement over the situation in Texas some twenty years ago when rural laborers were found to be living in chicken coops. In contrast, the rural unincorporated subdivisions of the Mexican border are castles. The *colonias* are unincorporated rural subdivisions lacking services and featuring the worst public health menace in America.

In a situation where workers routinely endure such deprivation, California agricultural experts say that projected labor shortages have proven to be largely mythical. The number of people currently residing in the United Sates who want to work is simply too great. Once again, when considering the contrary arguments of growers, Congress should ask itself fundamental questions about wages and working conditions.

One of the most renowned agricultural economists in the world, Professor Philip Martin of the University of California at Davis, says that contrary to grower arguments, U.S. agribusiness has consistently experienced a labor ***oversupply***. He does not see a shortage on the horizon.

As for the "need" of consumers for cheap fruits and vegetables, one might also allege a "need" for inexpensive but high quality automobiles. But having a "need" does not automatically imply that the nation should expand the supply of unskilled foreign labor supply in order to meet that need. Field labor is but a small percentage of the retail price.

Again, the question is not so much whether consumers will be deprived of fruits and vegetables, but what price the free market will oblige them to pay. Even then, it is not as if the demand for fruits and vegetables is inelastic. People will forgo or buy less of what they cannot afford. Strawberries are not essential to human survival.

In America, products are supposed to be offered for sale in a free market. There is no God-given right to cheap and exploitable foreign labor, and there is no God-given right to cheap fruits and vegetables. Yet such an assumption is inherent in many of the arguments made by argibusiness.

Later in my comments, I will consider the factor of "external" costs related to foreign agricultural labor. Such costs raise a legitimate question as to whether the constant replenishment of the agricultural labor supply represents a *de facto* labor market subsidy to growers that is being unwittingly paid for by all taxpayers.

Arguments about skyrocketing prices for produce should be carefully analyzed against the historical record. In the years leading up to the termination of the U.S.-Mexico agricultural guestworker accord, or Bracero Program, at the end of 1964, growers routinely argued that a lack of labor would cause the price of tomatoes to skyrocket. Instead, the price fell.

Why? Because the sudden decline in the volume of available agricultural labor promoted the development and availability of something that growers often refuse to discuss openly--the introduction of mechanization in the tomato industry. Mechanization not only staved off the economic ruination that agribusiness had warned against, it also increased efficiency and productivity and actually led to a drop in prices.

Congress may wish to note that within the last two months, Florida sugar cane growers have finally decided to mechanize because of world competition on the global sugar market. Sadly, this is occurring some thirty years after Edward R. Murrow's famous expose of brutal working conditions in Florida agriculture in the celebrated documentary, "Harvest of Shame."

Now, it is true that not all categories of produce lend themselves to mechanization. But the basic point is that a blind acceptance of demands for additional foreign agricultural labor will help ensure that such alternatives never materialize. It will actually promote the continuation of a labor intensive system. If Congress is concerned with the nation's increased economic efficiency and productivity, it may wish to ponder what a continued blind reliance on labor intensiveness in agriculture implies for the country over time.

There is no reason to question the sincerity of agricultural employers when they talk about the possible ruination of their enterprises. And they are doubtless concerned that American consumers will not be blessed with the fruits--and vegetables--of their labor, or that of their guestworkers.

However, I would suggest that if Congress is to examine the full range of factors, it must consider a fundamental point of economics that agricultural employers almost never volunteer: To wit, the greater the number of workers there are vying for a particular job, the lower the wages and working conditions agricultural employers will be obliged to offer.

Congress has considered these issues before. Some, if not all, of you will remember that a landmark legislative compromise occurred less than a decade ago in the context of the 1986 Immigration Reform and Control Act, also known as the Simpson-Rodino bill. At the time, agricultural interests said they would be satisfied by an expansion in the number of agricultural workers through a Special Agricultural Workers provision. Nearly 1.1 million formerly illegal aliens purporting to be agricultural workers were granted legal status in a program saturated with fraud.

Keep in mind that the main point of the 1986 act was to implement an employer sanctions mechanism that would allow the United States to control illegal immigration. After having agreed to the legislation because of the legalization of agricultural workers, agribusiness is, in effect, now coming back to repudiate the compromise of 1986 and ask for still more foreign agricultural labor.

The difference is that this time around they do not want such labor to be afforded the opportunity to legalize. This time they do not want totally free labor. This time they want guestworkers.

According to testimony I heard from agribusiness and its representatives in California last month, the new request is predicated on the assumption that loopholes in the employer sanctions law of 1986 may actually be plugged by Congress in the near future. They referred specifically to the expected passage and implementation of a worker

verification system.

If that happens, agribusiness fears a decline in its labor supply. In this regard, Congress should know that a representative of the Western Grower-Shipper Vegetable Association publicly stated last year that illegal aliens comprise 50 percent of the work force of the Santa Maria Valley in Santa Barbara County, California. This is not necessarily evidence that only alien workers are available, but rather that the growers are hiring large numbers of aliens.

Congress should take careful note of what this new argument is really saying. In effect, growers are claiming that while agribusiness is not knowingly hiring illegal aliens--an act that is illegal under the 1986 legislation--they are nonetheless fearful that if the law is actually enforced, agribusiness will have fewer illegal aliens to hire.

I have no specific evidence to justify the assertion that agricultural employers are knowingly hiring illegally aliens as defined under IRCA, and I will not make that charge here. Yet, whatever defense they may raise in the context of the confusion over work eligibility documents--the factor cited as the main drawback to effective employer sanctions enforcement--that cannot be permitted to cloud the fact that the growers are fundamentally opposed to the spirit of the 1986 act, which, to repeat, is the reduction and control of illegal immigration.

Agribusiness now says we should forget about the compromise of 1986 and revive the so-called Bracero Agreement or expand the H-2A program. Before Congress acquiesces in such a request, it may wish to weigh the growers' assertions against powerful evidence from many agricultural areas that unemployment is high in rural labor sectors. That certainly was the message I recently heard during a visit to Fresno.

Moreover, labor economists point out that California agribusiness in particular does not want so much a stable supply of labor, but rather a dependable system of constantly disposable and replenishable labor. Foreign labor is best for their needs precisely because it represents a never-ending pool and because the constant replacement of such labor ensures that the entire workforce will, in the classic phraseology of those who are familiar with the bottom line of illegal or legally admitted but not totally free labor, "work hard and scared."

Those who doubt this should inquire about the labor made legally available to growers by Congress a decade ago. Reports emanating from California note that formerly illegal aliens who were legalized under the 1986 Special Agricultural Workers provision are today deeply concerned that they are about to be displaced by a new agricultural guestworker program or the expansion of an existing one. They fear being tossed aside as the next victims of what might be called the Dixie Cup system of labor replenishment.

In my opinion, they are right to be afraid. Longtime observers know that the constant replacement and replenishment of labor is the Holy Grail of the agribusiness labor system.

In passing, I should also note the important side issues of unemployment benefits and Social Security taxes. Illegal aliens are not eligible for unemployment benefits, which, in the case of unemployed legal workers, are charged against an account for which the individual employer is responsible. Citizens and legal residents are eligible for such benefits. In effect, agricultural employers end up paying around 4 percent less for those workers who are not eligible for unemployment benefits than for those workers who are.

By itself, that may be a compelling reason for agricultural employers to promote a constant supply of labor that is not eligible for the benefit made available to legal residents. More dramatic still is the factor of Social Security taxes. Hiring foreign workers for whom Social Security taxes are not paid represents nearly a 15 percent wage premium right off the bat. No matter how hard a citizen of the United States may work in the fields, these factors represent two strikes against his or her employment in the agricultural sector.

Congress should consider such points the next time it hears that illegal aliens and guestworkers do jobs Americans won't do. Still, to focus only on the costs of labor in the fields would be to miss one of the most important facets of the entire issue. Congress would be well advised to weigh other real-world costs, as well.

External Costs

On November 15, about three weeks ago, I was present at a hearing of the U.S. Commission on Immigration Reform in Fresno. The hearing dealt with the issue of agriculture and foreign workers. That hearing only underscored a point that has been made time and again throughout the Southwest and West, in particular. Illegal immigration and legalized illegal aliens represent costs for the nation that go far beyond the cost of their labor.

In Fresno, I heard the testimony of Mayor Jim Patterson, who complained that the residents of his agriculture-based city are currently paying what he calls "a large immigration tax." Mayor Patterson specifically blamed this unwritten and unlegislated tax on the federal government.

Specifically, he complained about Congress' failure to control the borders. He pointed to specific areas in which his city will no longer be receiving funding from the federal government because of congressional reforms. He also linked the growing social and budgetary impact of massive legal and illegal immigration to the unprecedented ballot initiative to deny public benefits to illegal aliens, known as Proposition 187. At the same time, however, he expressed support for an agricultural guestworker program.

Both he and all other elected officeholders interested in this public policy issue, including Congress, may wish to ask themselves if we as a society can have it both ways. In other words, can we lament the consequences of the expansion of the low-skill, low-wage labor supply and then turn around and lobby for the admission of still more of that labor?

It may make political sense in areas and states where agriculture is a powerful industry, but does it stand the test of common sense? Does it make budgetary sense? Is it in the national interest?

In truth, a gamut of publicly-funded costs must be considered by policymakers who seek to ascertain the impact of legislating an expansion of foreign agricultural labor. Assuming for the sake of argument that the workers in question and their families do not access the welfare system, policymakers should consider costs relating to basic services, such as running water and waste water, street maintenance, police and fire services, public health services, publicly-funded housing, the administration of justice, food and shelter for prisoners, public education, heightened unemployment and underemployment, and the consequent utilization of unemployment and other benefits by displaced citizens and other legal residents.

In Fresno alone, huge increases in waste water flows have obligated the city to build a $200 million expansion to the city's waste water treatment facility. After investigating the heightened demand, city authorities routinely found examples of families with ten, twelve, and even fifteen children, and a total of twenty or thirty people living in one- or two-bedroom apartments, according to Mayor Patterson.

Also, Congress should consider that just because it is difficult to put a price tag on a concept, such as the dilution of quality of life stemming from overcrowding, that does not mean that such a price is not being paid.

When one takes into consideration the gamut of costs that U.S. citizens and legal residents are paying as a direct result of the large-scale presence of foreign agricultural workers, illegal and legal, the residents of an individual community, such as Fresno, are not the only ones who are being impacted. Other agriculture-based communities, the citizens of California as a whole, and the citizens of the United Sates also pay for such costs to one extent or another.

Agricultural work is by definition seasonal. Yet, regardless of theory, the fact remains that even after the harvest season is over, the agricultural laborers often remain. Congress should fully understand the implications of too easily acquiescing in demands for massive influxes of additional foreign agricultural labor, *ex ante*--that is, before there is evidence of need--instead of *ex post*.

Regardless of whether inexpensive alien agricultural labor helps keep the costs of fruits and vegetables down for consumers, it must be weighed against the costs that are external to the economic activity in agriculture itself. When the gamut of associated public costs are taken into consideration, such additional costs can only be perceived, in my opinion, as a labor market subsidy paid for by the public to the agricultural employers. I have not ventured to estimate the size of that subsidy. But surely it is in the hundreds of millions of dollars.

Agribusiness routinely talks about the high quality of its produce. At that real-world price, it had better be very good

indeed. Whatever else one may say about this situation, I consider it to be fundamentally antithetical to the principles of a free market. When the economics of agricultural labor is weighed in its totality, there is reason to ask whether agribusiness today is privatizing the profit while commonizing the cost.

Social Consequences

For about a quarter century now, the United States has been experiencing what immigration experts have called the Fourth Wave of American Immigration. In 1965, Congress reintroduced mass immigration after a hiatus of some forty years.

All evidence indicates that it did not understand the consequences of the new policy. Indeed, the history of modern U.S. immigration policy is the history of dealing with the unintended consequences of each new policy shift.

The current wave of immigration is the first one to occur in America's postindustrial era. Similarly, it is the first one to occur since the creation of the modern American welfare state. Both these facts have enormous consequences for our society.

This is not the place to explore the factors related to socioeconomic polarization in the United States today. Suffice it to say that labor experts routinely note that the prospects of upward mobility in the country today are not what they once were. Prospects are best for people with relatively high levels of skills and education and, logically, they are worse for people with few or no skills and little or no education.

More to the point, the jobs being created today are in the higher end, not the lower end. Simultaneously, immigration today accounts for about 40 percent of labor force growth and about 40 percent of population growth. Against this backdrop, Congress should ask itself whether expanding the supply of low-skill and often uneducated labor is advisable.

The proponents of a revived agricultural guestworker system or of the expansion of an existing program such as H-2A will likely argue that such observations are irrelevant to their case. After all, they say, the introduction of low-skill labor they are calling for is "temporary." Moreover, the proponents of such programs have also suggested that the revival of "Bracero" or the expansion of H-2A will in fact serve to diminish the pressures of illegal immigration.

To be sure, seasonal cross-border migration by young male agricultural laborers does exist. At the same time, however, it is also true that all guestworker programs have seen the refusal of substantial numbers of workers to return to their homelands. Many have either resettled their families in the United States or have established families here after having arrived.

The growers may call it "temporary" labor. Congress may call it "temporary" labor. But that does not mean that a substantial portion of that labor will in fact turn out to be anything other than permanent. In fact, this is the clear and consistent record of the Bracero Program and indeed of all "temporary" worker programs in Western countries.

As for the possibility that expanding the number of agricultural guestworkers will reduce illegal immigration, the historical record simply does not bear this out. Contrary to the recently published Pollyannish opinions of Professor Julian Simon and others, history indicates that the Bracero Program actually paved the way for higher levels of illegal immigration and dug the channels deeper.

Professor Simon has attempted to buttress his argument by citing examples of very low levels of illegal immigration in the 1950s. Yet, for whatever reason, he has refused to acknowledge the year 1954, in which more than one million apprehensions of illegal aliens occurred. More to the point, during the 22 years of the Bracero Program, when approximately 4.6 million braceros were admitted into the United States, no fewer than 5.3 million apprehensions of illegal aliens took place. [See accompanying table.]

Congress may judge for itself whether the Bracero Program reduced illegal immigration in the past. As for the future, it may wish to consider this question in the context of the current economic turmoil in the largest source of illegal alien agricultural labor to this country, Mexico.

If history is any guide, substantial numbers of temporary guestworkers will in fact become permanent members of our society. Sometimes, this may even occur regardless of their own initial intent. Such vagaries will only increase the difficulty of assimilating low-wage, low-skill Americans of all backgrounds into the social and economic mainstream. Given that the coincidence of race and poverty is one of the most challenging issues facing the United States today, Congress may wish to consider the long-term consequences of importing more unskilled labor.

Consider the following example: Recently, the tri-counties of Ventura, Santa Barbara, and San Luis Obispo in California were granted a Job Training Partnership Act grant of $511,605 to retrain farmworkers. One local expert whom I have interviewed told me that the application stated in part: "Since IRCA was passed in 1986 the ranks of farmworkers have dramatically increased. . . . The population eligible to receive these benefits (unemployment insurance) is estimated to exceed 76,500 workers" in the three counties cited.

The cost of retraining all 76,500 farmworkers in just three counties would be a staggering $466 million. Yet, the Department of Labor has only $82 million available ***nationwide*** to retrain farmworkers throughout the United States.

I am not here to argue for greater appropriations for job training programs. But I am suggesting that Congress consider the real-world costs of expanding the agricultural labor supply in terms of such factors as heightened unemployment and the heightened demand for social services. Without entering into the debate over devolution, I would suggest that Congress also consider this factor.

American Values

As Congress considers reviving or expanding guestworker programs, it may wish to ask itself a number of basic questions. Here are a few for your consideration:

If a guestworker is tied by law to one employer, what is the range of limitations on the freedom of that guestworker? What happens if the agricultural guestworker wishes to leave the agricultural sector and work elsewhere in the U.S. economy? What happens if the guestworker falls in love and wishes to marry a legal resident? What happens if a guestworker should become the parent of a child born on U.S. soil, even if the guestworker is single?

Who, exactly, is responsible for ensuring that such guestworkers do not go into other labor sectors? What, exactly, is the penalty for failure to comply with any such responsibility? Who, exactly, is to oversee the enforcement of any such rules, regulations, and law? Exactly what resources will Congress afford those given that mission?

A failure to carefully answer these and many other questions would, I believe, represent a failure on the part of Congress to ensure truth in advertising. That is to say, if Congress proposes to legislate a temporary guestworker arrangement, then Congress, in my view, has the responsibility to ensure that it is temporary. The litmus test for any guestworker program is whether that program contains mechanisms to ensure the return of the guestworker.

If, upon due consideration, Congress wishes to grant full and permanent legal status to foreigners willing to work in agriculture, then Congress should do that. But to promise one thing, while failing to ensure that the promise is kept, will only intensify the already deep frustration felt by the American people over an immigration system most of them consider to be in shambles, according to poll after poll.

Finally, when the United States went to war in the Persian Gulf a few years ago, we as a nation were hugely embarrassed when, upon liberating Kuwait, we discovered that country's exploitative guestworker system. In Kuwait, guestworkers were seen as being good enough to do the dirty work of their hosts, but not good enough to become full members of the polity. Indeed, they were often treated with a disdain that recalled some of the worst features of nineteenth century American slavery.

Filipino domestic servants, for example, were found to have no legal rights whatsoever, their passports were found to have been seized upon admission, they represented unfree labor tied explicitly to their employers, and they were often subjected to physical and even sexual abuse. All of these excesses are exactly the kinds of things Americans have been trying to erase from their nation for decades.

But the plain fact of the matter is that agricultural guestworker programs are themselves affronts to human dignity and freedom to one degree or another. In no western liberal democracy has such a program been successful. All of them have experienced troubling consequences. Congress may wish to consider the droll observation of one European observer of the guestworker experience: "We wanted workers, but we got people instead."

I commend you for studying this complicated and challenging issue. I fully realize the pressures you face. I wish you Godspeed. But please allow me to help you make up your mind one way or the other by taking a clear stand in my testimony here today: I cannot and will not recommend the Kuwait model of guest labor for the United States.

Thank you again for your courtesies and for inviting me to testify.

Apprehensions During the Bracero Years

Year	Apprehensions
1942	11,784

*Operation "Wetback"

Total of 5.3 million apprehensions during the 22-year period, while approximately 4.6 million braceros were admitted.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Barbara Jordan
Professor, Lyndon Baines Johnson School of Public Affairs
University of Texas at Austin
Chair, U.S. Commission on Immigration Reform
Before the House of Representatives
Committee on the Judiciary
Subcommittee on Immigration and Claims
December 13, 1995

Birthright Citizenship

Good morning. I am Barbara Jordan, and I am pleased to have this opportunity to testify on such an important matter. I am here in a dual capacity. I was once a member of the House Judiciary Committee, and I have studied the Constitution. Presently, I teach political values and ethics at the LBJ School of the University of Texas. I hope I can bring some education and experience to bear before you today.

I am also Chair of the bipartisan Commission on Immigration Reform. As you know, our Commission has been deeply engaged in debate regarding our national interest in sound immigration policy--in solving problems, completing unfinished business, and avoiding future error. We have issued two reports to date, making recommendations for specific reforms to Congress. Our first report recommended a comprehensive strategy for deterring illegal immigration. It is called *U.S. Immigration Policy: Restoring Credibility*, and I will have more to say about it in a moment.

Our second report is called *Legal Immigration: Setting Priorities*, which we presented to Congress this spring. We on this Commission have been gratified that our work has helped this Subcommittee in preparing legislation to advance the national interest in immigration policy. We are a Congressional commission, and it is our job to serve you.

But this Commission has not made recommendations on the matter before you today. As a bipartisan Congressional panel, we have not addressed the 14th Amendment's application to immigration. But, personally I would like to do so now--briefly.

There are profound problems, as I see it, in the Constitutional amendments before this Subcommittee. By making the immigration status of the mother the key to an American-born child's citizenship, for example, one of these amendments would require that the federal government disown its obligations to citizen children. Consider the case of a citizen father married to a foreign mother. If the child is born abroad, the child is automatically made a U.S. citizen upon petition. If the child is born while the mother is in the United States, perhaps by overstaying a tourist visa from Thanksgiving to Christmas, neither the father's citizenship nor the birth on U.S. soil of an American child provides that child American citizenship. In fact, the father's natural right to pass on his citizenship to the child is denied. He must ask the government to bless his child.

But it is not the practical problems, profound as they are, on which I wish to focus. It is the principle.

There are three ways to become an American--by choice, through naturalization; by blood, through having an American parent; and by birth in the United States. It is also true that most nations do not have these three methods. The simplest contrast is Germany. With very few exceptions, you can only be a German if your ancestors were German. There are hundreds of thousands of second and third generations of people, born in Germany, knowing no other nation, who are not German, who will never be German. Congress should think again whether you wish to make the United States more

like Germany.

De Tocqueville wrote of America that, "The government of a democracy brings the notion of political rights to the level of the humblest citizens." And that is what we are talking about: citizenship. It is a beautiful word. It is an American word. The modern concept of citizenship is largely an American invention. It has Greek and Roman roots, to be sure. But we grew in the soil of the United States the modern concept of citizenship that so much of the world has adopted at last.

With all due respect to my Republican colleagues, the true "conservative revolution" happened in 1776. The Founders, you will recall, originally fought only to claim as colonists their rights as Englishmen. It was when King and Parliament denied those rights that they took the revolutionary step of asserting that these rights were not granted to them as subjects from the Crown, but that "We hold these Truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable rights." This idea--the *American* idea--is that governments do not grant rights. We are born with them.

I would be the last person to claim that our nation is perfect. But we have a kind of perfection in us because our founding principle is universal: that we are all created equal regardless of race, religion, or national ancestry. When the Declaration of Independence was written, when the Constitution was adopted, when the Bill of Rights was added to it, they all applied almost exclusively to white men of Anglo-Saxon descent who owned property on the East Coast. They did not apply to me. I am female. I am black. But these self-evident principles apply to me now as they apply to everyone in this room.

To deny birthright citizenship would derail this engine of American liberty. Progress in America is not an accident. It was immigration that drove us down the track toward a broader and more truthful vision of ourselves. It was immigration that taught us that, in this country, it does not matter where you came from, or who your parents were. What counts is who you are. The 14th Amendment to the Constitution says, in part: "All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State in which they reside."

This was originally a statute, the Civil Rights Act of 1866. Its authors knew that, as a statute, it was vulnerable to being overturned by future lawmakers. That, they determined, must not happen. We must not forget the history of the 14th Amendment, or the context in which it was passed. We had fought a bloody civil war. And now, three amendments to the Constitution were adopted--to end slavery; to provide equal protection of the laws; and to guarantee the right to vote.

I do not believe it is possible to amend the Constitution, or alter the meaning of its words, by statute. In this case, any attempt would have significant negative consequences. For example, H.R. 1363 would specify that certain children of illegal aliens are "not subject to the jurisdiction of the United States." Do we really want to give these individuals immunity from federal prosecution for criminal acts? I am not sure how we could prosecute someone not subject to our jurisdiction.

So, if the Congress wishes to deny birthright citizenship to children of illegal aliens, it must follow the intentionally arduous path of a Constitutional amendment. I hope that you will not take this step.

A constitutional amendment requires a supermajority vote in both the House and the Senate and the ratification of two-thirds of the state legislatures, presently thirty-eight states. Even if--which I oppose --it was sound policy to so amend the Constitution, it will take time. It will take resources. It will divide the country on the most profound level--the question of who we are as a people and who says so.

Let me go beyond my personal views here, to speak as the Chair of the U.S. Commission on Immigration Reform. Do not let debate on birthright citizenship distract you from the urgent business of controlling illegal immigration, which is essential to the credibility of our commitment to the national interest in legal immigration.

Ably led by your Subcommittee Chair, Lamar Smith and the ranking minority member, John Bryant, you have an opportunity in this Congress to take significant steps to deter illegal immigration and promote lawful immigration in the national interest. You have labored in this Subcommittee to produce a bill, H.R. 2202, which takes some of the prudent,

measured steps recommended by this bipartisan Commission to do what needs to be done. The comprehensive strategy this Commission recommended last year to deter illegal immigration has seven parts:

1) Better border management;
2) Development of a better system for worksite verification;
3) Benefits eligibility consistent with the goals of immigration policy;
4) Deportation of illegal aliens;
5) Emergency management;
6) Reliable data;
7) Attacking the root causes of unlawful migration in the sending countries.

There is no one who knows better than those who serve on this Commission how hard it has been to advocate these tough choices. But we believe that they are necessary and that through your actions as legislators valuable progress in all of these areas is within reach.

Please do not be distracted from these real measures to attack illegal immigration through the Constitutional amendment process. There are far better ways to deal with illegal immigration than to cut the Constitutional baby with a sword and say, "This half is a citizen, and that half is not."

There will be those who will try to deny reality when the whole House faces this issue shortly. But the vast majority of illegal aliens do not come to America to bear children, although it does happen. In three years and dozens of hearings, consultations, and expert discussions, no one has ever reported to the Commission that the vast majority of births to illegal aliens are anything more than a reflection of the large numbers of illegal aliens who are here. The reason most illegal aliens come to our country boils down to three words: They get jobs.

There will be a vote on the House floor on retaining the provision to test worksite verification that the Judiciary Committee approved in H.R. 2202. There will be those who claim that it is not worth testing the system you have endorsed. There are also those who whisper in these hallways that illegal immigration isn't so bad, so long as they will work hard for low pay, so long as they do the dirty jobs that Americans supposedly won't do, so long as their children aren't to become Americans.

Caution: There are nations in the world that have tried this, and we are not like them. We are not a nation that is permanently divided into "us", and "them." You heard last week from my colleague on the Commission, Richard Estrada, who gave as his view that the United States must not follow the Kuwait model, where citizens are the privileged elite and foreigners do the dirty work. I agree.

The Commission on Immigration Reform has outlined a comprehensive strategy to deter illegal immigration--including the development and testing of a reliable system for worksite verification that protects our civil liberties.

I believe that treating us all alike is the appropriate way to attack illegal immigration. I will be delighted to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Susan Martin
Executive Director, U.S. Commission on Immigration Reform
Before the U.S. Senate
Committee on the Judiciary
Subcommittee on Immigration
February 6th, 1996

On behalf of the Members of the U.S. Commission on Immigration Reform, I want to thank you for the opportunity to testify before you today.

First, I would like to say a brief word about our Chair, the late Professor Barbara Jordan. Professor Jordan accepted appointment as Chair because she believed that debate about immigration policy and reform of its problem areas were necessary if we were to retain our strong tradition as a nation of immigrants committed to the rule of law. I know that she was very proud of the work of the Commission and grateful to the members of this Subcommittee, in particular, for the support you have given the Commission, as well as for the many courtesies you showed her as Chair. We hope that the rest of the Commission's work in fulfilling the mandate of the 1990 Act, with a series of interim reports before the final report on September 30, 1997, will live up to the high standard she has set for us.

The Commission is pleased that this Committee continues to examine the eligibility of immigrants for public benefits, with particular attention to the Supplementary Security Income program. The Commission strongly recommends that legal immigrants continue to retain eligibility for the safety net provided by needs-tested public programs, but further recommends a tightening of provisions to ensure that immigrants do not become public charges.

That immigrant utilization of SSI is growing is confirmed by administrative data. Rather than go into detail on the data itself, which I do in my written testimony and which others have done today, let me briefly note the Commission's recommendations along with their reasoning.

The Commission believes the following principles should guide policy on benefits eligibility for SSI.

Legal Immigrants

First: The safety net provided by needs-tested programs should be available to those whom we affirmatively have accepted as legal immigrants into our communities. The U.S. admits immigrants on the basis that they will not be a public charge. However, circumstances may arise after an immigrant's entry that create a pressing need for public help--unexpected illness, injuries sustained due to a serious accident, loss of employment, a death in the family. Under such circumstances, legal immigrants should be eligible for public benefits if they meet other eligibility criteria. We are not prepared to remove the safety net from under individuals who, we hope, will become full members of our polity.

A policy that categorically denies legal immigrants access to such safety nets based solely on alienage would lead to gross inequities between very similar individuals and undermine our immigration goals to reunite families and to integrate immigrants into American society quickly. For example, posit a family whose income is below poverty level with two children, one a legal immigrant who becomes disabled after entry, the other a healthy U.S. citizen born after the family immigrated. Under proposals to deny benefits to legal immigrants, the disabled child would be ineligible for assistance, while the healthy U.S. citizen child would be eligible for assistance if the family met income requirements.

The inequities for the legal immigrant child grow if eligibility is linked to citizenship, rather than a specified time, as the child by law may not naturalize until he or she is eighteen years of age. The only route to citizenship prior to that age is through the naturalization of his or her parent. If there were a categorical denial of eligibility to all legal immigrants and the parent was unable or unwilling to naturalize, the child would suffer the consequences of a parental action that he or

she could not remedy.

Second: Sponsors should be held financially responsible for the immigrants whom they bring to this country. In particular, the Commission recommends making affidavits of support signed by sponsors legally binding for a specific period of time and the development of mechanisms to enforce sponsors' pledges of financial responsibility.

Affidavits of support are one means to ensure the Consular Officer that the alien will be supported in the United States and will not become a public charge. In accordance with Board of Immigration Appeals [BIA] rulings, the signatory sponsor's ability to provide the promised support must be given due consideration in determining whether to exclude a person as likely to become a public charge. Some courts, however, have held that such affidavits of support impose only a moral--and not a legal--obligation on the signatory sponsor.

It is important to note that the affidavit of support becomes a condition of entry only when the Consular Officer finds that the intending immigrant is likely to become a public charge. In other words, if the sponsor did not promise to provide support, the immigrant would not be allowed to enter the United States. We believe this promise should have greater force in law to ensure that the responsibilities are upheld.

The affidavit should ensure that parents who are unable to work enough quarters to become eligible for Social Security or Medicare do not become a burden to taxpayers through use of SSI, Medicaid, or equivalent state and local assistance. Further, the Commission recommends that affidavit signers (petitioners and, if necessary, coguarantors) should provide:

- Verifiable assurance that they indeed have the capacity to provide what may be a lifetime of financial support to the parent immigrants; and

- Verifiable assurance of the purchase of what may be lifetime health coverage for the parent immigrants (obtained either privately or through buying into Medicare, which the government should make available at an actuarially fair price).

Requiring such a commitment from sponsors should not be confused with a bar on eligibility for the immigrant before or after naturalization. As I stated, the Commission recommends against categorical denial of eligibility on the basis of alienage. Legal immigrants and citizens should be treated alike as far as their eligibility is concerned. If a sponsor is no longer able to provide support, the needy immigrant should have recourse to public benefits. If the sponsor abandons his or her responsibility, the needy immigrant should have recourse to public benefits. All efforts should be made, however, to enforce the sponsor's legal responsibility to repay the public coffers and resume support as quickly as possible.

The distinction between eligibility and financial responsibility is an important one that affects not only immigrants but citizens as well. For example, a U.S. citizen child may be eligible to receive public benefits if he or she meets income criteria, but the child's eligibility does not dissolve his or her parent from the financial responsibility to provide support to the child. Similarly, a U.S. citizen spouse retains eligibility for benefits, but that does not absolve his or her spouse from financial responsibilities.

The equivalent relationship in immigration policy is the affidavit of support signed by sponsors of new immigrants. Just as a parent's responsibility for a child is irrespective of the child's citizenship, the sponsor's responsibility for a parent whose entry is conditioned on a contractual arrangement specified in the affidavit is irrespective of future naturalization.

The Commission further recommends that entry be contingent on verifiable assurance of the purchase of health insurance, again for the lifetime of the parent or until the parent becomes eligible for Medicare on the basis of his or her work history. Without such a health insurance requirement, parents are likely to access taxpayer-financed health programs such as Medicaid or general assistance. We recognize that such a requirement may be prohibitively expensive for many families, particularly if the parent is over the age of sixty-five. The current private health care market generally lacks affordable health plans covering doctor, hospital, and long-term care services for elderly individuals. Moreover, most private long-term care policies are limited in both duration and extent of coverage. Therefore, we recommend that the government establish an option that would allow sponsored parents age sixty-five or older to purchase Medicare (parts A and B) at an actuarially fair price, which we understand would be about $4,000 to $5,000 per year. On top of that, the parent or sponsor also would have to show purchase of a long-term care policy that would offset some or all of

the costs that might otherwise accrue to Medicaid.

The Commission does not intend a legally binding affidavit of support to be a punitive measure towards either the sponsor who attempts to meet the requirements in good faith or the immigrant who may be financially abandoned by the sponsor. If the sponsor becomes financially incapable of providing support because of changed circumstances (the sponsor's illness or accident, for example), the requirements of the affidavit would be removed until the sponsor was able to resume them. If the immigrant is abandoned, however, the legally-binding affidavit permits the immigrant to obtain help while the efforts are made to enforce the sponsor's responsibility.

This recommendation permits the continued entry of parents because it would assure that they would not be excludable as public charges who pose a burden to U.S. taxpayers. It also protects sponsored spouses and children by enforcing affidavits signed on their behalf and ensuring that assistance is available to them if the sponsoring parent or spouse is unable or unwilling to provide support. Finally, it protects the taxpayer. As Professor Jordan said in a speech last summer:

> "[E]ven nuclear family reunification is not without obligations on the part of those who benefit from immigration. The Commission believes that those who sponsor new immigrants have responsibility for ensuring that their relatives do not become a burden on taxpayers. You and I should not have to pay for someone else's family reunification."

Developing effective enforcement mechanisms related to the affidavit is critical to the success of this recommendation in order to avoid creating any future incentives to abuse or defraud the system. A number of options may be appropriate, including a role for the Department of Justice in investigating alleged abdications of responsibility that lead to use of public benefits. Federal, state, and local programs providing cash and medical assistance could be required to report to the Department of Justice the receipt of benefits by any sponsored immigrant. This approach would establish affidavit enforcement activities within the primary law enforcement agency and avoid placing additional enforcement burdens on health and social service programs. Alternatively, the enforcement could be undertaken by the Department of Health and Human Services or the Social Security Administration. In any case, communication among these agencies would be essential.

Third: Abuse of the public charge provision should be grounds for deportation. A serious effort should be made to enhance and enforce the public charge provisions in immigration law to ensure that legal immigrants do not require public assistance and to provide clear procedures for deporting individuals who become public charges within five years after entry for reasons that existed prior to entry. In particular, the Commission recommends that deportation apply to sustained use of public benefits.

Specific provisions within U.S. immigration law are designed to ensure that those persons seeking admission to this country will contribute to it, not merely take advantage of its resources and the generosity of its people. For example U.S. immigration law currently bars the entry of those who are likely to be public charges and contains provision for the deportation of individuals who become public charges within five years--unless they require aid for reasons that developed after entry. Effective enforcement of these provisions helps minimize the number of legal immigrants who need or depend on public assistance.

Refugees

Let me conclude with a few words about refugees and their eligibility for SSI. The Commission currently is undertaking a full examination of the domestic assistance program for refugees resettled in the United States. My remarks here are more personal, based on fifteen years of work on refugee issues, rather than on behalf of the Commission. The high rate of welfare dependency has been a concern to all of us who have interest in maintaining a strong U.S. commitment to refugee admissions. Certainly, many refugees become economically self-sufficient and important contributors to our economy and broader society. However, a significant proportion of refugees continue to receive public assistance many years after their entry. Some refugees clearly need significant levels and periods of assistance. It is unreasonable to assume that an elderly, seriously traumatized refugee will become self-supporting. Barring that person from eligibility for SSI after a specified period undermines the humanitarian nature of our original decision to admit him or her. But, many more refugees are dependent on public programs, including SSI, than can be explained by the presence of this

relatively small number of seriously disabled victims of persecution.

Welfare reform provides an opportunity to revisit the refugee assistance program. So, too, does the expected change in the number and composition of refugee admissions once resettlement has wound down in the two major, Cold War-related programs for admission of refugees from the former Soviet Union and Southeast Asia. I hope that the Congress will give the Commission time to finish our investigation and consultations with the Executive Branch, private resettlement agencies, state governments, and others before adopting changes in SSI or AFDC policy that could have significant ramifications for refugee resettlement.

I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Harold Ezell
President, The Ezell Group, Inc.
Member, U.S. Commission on Immigration Reform
Before the House of Representatives

Committee on Economic and Educational Opportunities
February 22, 1996

Mr. Chairman, Members of the Committee, I want to thank you for inviting me to testify here today, and I also want to welcome you--those of you who are not Californians--to the State of California. I know that Randy Cunningham agrees with me that it is a good thing when committees of the Congress come back to the rest of the nation to see the effects of the policies which you enact in our behalf. It is especially fitting that you are here in San Diego to examine immigration policies. We all hope that you learn something while you are here, and all of us Californians will be glad to help you in that endeavor.

My name is Harold Ezell. I am President of the Ezell Group, which is an international financial and business consulting firm based in Newport Beach. Years ago, I founded a chain of restaurants, so I have considerable real-world business experience. Based in part on that experience, President Ronald Reagan appointed me to be Western Regional Commissioner for the INS. While I was Western Commissioner, we implemented the Immigration Reform and Control Act, including both the amnesty provisions and sanctions on employers who knowingly hire illegal aliens.

I left the INS after the Reagan administration to return to the private sector--gratefully--but I have stayed active in the immigration debate. In 1992, the House Republican Leadership appointed me to serve on the U.S. Commission on Immigration Reform, which is a bipartisan Congressional advisory commission. It is important to hear that word "bipartisan," because immigration isn't a partisan political issue. All of the Commission's recommendations have been unanimous, or with only one dissenter. This from a nine-member Commission with Reagan Republicans and Tip O'Neill Democrats on it, who don't agree on anything--except on how important it is to preserve our heritage as a nation of immigrants dedicated to the rule of law.

The American people are fed up with illegal immigration. It is against the law, and I would remind you that every one of us who has served in public office takes an oath to ensure that the laws are faithfully executed. If thefederal government was doing its job to stop illegal immigration, there would never have been a need for Prop 187, which was supported by an overwhelming majority of California voters, nearly 60 percent.

I am speaking here in my capacity as a member of the Commission on Immigration Reform. In our first report to Congress in September 1994, entitled *U.S. Immigration Policy: Restoring Credibility*, we sought to recommend a comprehensive strategy to faithfully execute the laws against illegal immigration. We chose to focus much of that report on controlling illegal immigration.

Now, let me be clear about this: illegal aliens do come here and use welfare and other public benefits programs. They do send their kids to our schools, and have babies in our hospitals. Those are very serious matters, and they impose costs on the taxpayer. But I am here to tell you, that the reason most illegal aliens come here can be summed up in three little words: *They get jobs.*

Reducing the employment magnet has to be the linchpin of a comprehensive strategy to reduce illegal immigration. Jobs are the attraction. So the only effective way to deter illegal immigration must include the worksite.

Better border enforcement is necessary, but not sufficient. In this San Diego Sector alone, apprehensions in fiscal 1995 were more than 524,000. You can police the border, you can certainly manage it better, but border enforcement has its

limits.

Visa overstayers make up fully half of the influx of illegal aliens who take up permanent residence here illegally every year. That is 150,000 out of 300,000 new illegal aliens who remain here permanently every year, on top of an illegal population that is already close to 5 million. No amount of border enforcement can solve that half of the problem--the people who enter legally, and then do not leave when they should.

We simply must develop a better system for verifying work authorization. That is central to effective enforcement of employer sanctions.

The I-9 process we have now is doubly-flawed. It does *not* do what it was supposed to do, namely deter the employment of illegal aliens. What it *does* do, we do not want--namely, make businesses do paperwork, while creating all kinds of opportunities for fraud and forgeries. It may even provide an excuse for, if it does not actually provoke, discrimination against workers who happen to look or sound foreign.

Honest employers are caught between the proverbial rock and a hard place. Because the system is based on documents, employers are placed in a position of making judgments many do not feel qualified to make.

If an employer accepts false documents presented by an unauthorized worker, that employer is vulnerable to employer sanctions for having hired someone under false pretences, regardless of the fact that they may well have been fooled themselves. Yet if an employer chooses to doubt particular documents, and asks for more from some workers and not from others, that is discrimination.

The Commission believes that the way to develop a better system of worksite verification is immediately to test the most promising option. After examining a wide range of alternatives, the Commission concluded that the most promising option for secure, nondiscriminatory verification is a computerized registry based on the Social Security Number.

For decades, all workers have been required to provide employers with their Social Security Number. We want to replace the I-9, this paper chase that doesn't do anybody any good, with a single electronic step to validate information every worker must already provide.

The Commission believes electronic validation of the Social Security Number is the most promising option because it holds great potential for accomplishing the following:

- **Reduction in the potential for fraud.** Using a computerized registry, rather than relying on documents, guards against counterfeits.
- **Reduction in the potential for discrimination.** All workers must present the same information to be validated.
- **Reduction in the time, resources and paperwork spent by employers in complying with IRCA.** INS employees who now chase paper could be redirected to chase down those who knowingly hire illegal workers.

The Commission believes that the computer registry will be preferable to other ways of addressing the problems in the current system. I recently looked at the Telephone Verification System, called TVS, which the INS has been testing. The INS is expanding this test, first from 9 to 200 sites, and eventually to 1,000 sites. I have seen ther system in place and working. It is very effective and accurate. Now, you should look at what the businesses that have used TVS say. They like it. They find that it works. We support this INS effort--but only as an interim measure. It is not the solution. But it shows the way to a solution.

The fatal flaw in the TVS system is that it ultimately depends on self-attestation. Workers are asked whether they are citizens or aliens. It is simply not sound law enforcement to rely on lawbreakers to tell the truth.

But the reaction from the real business that have used it shows that we can develop a better system for worksite verification. When you get back to Washington, don't be snowed by the inside-the-Beltway types who are going to try to

sell you a line about how this is some scheme to take away our liberties and impose costs on the taxpayer. What they want is to let employers hire illegal aliens--and *that* undermines our liberties and imposes huge costs on the taxpayer.

The Commission also looked at the feasibility and effectiveness of reducing the number of documents used in verification. Again, we support such efforts as interim measures. But the fatal flaw here is the vulnerability of all documents to counterfeiting. We heard expert testimony that any document, even the most tamper-proof ones, can be forged so well that only experts can identify the fakes. Employers cannot be expected to identify counterfeit documents.

The Commission recognizes that the computer registry cannot and should not be implemented nationally without substantial testing.

The Commission recommends that pilot projects be undertaken in the five highimpact states--California, Texas, Florida, New York and Illinois--because that is where the bulk of the illegal alien problem is. We also recommend that, in time, the pilots should be extended to several less-affected states. But we did *not* recommend that the registry be tested throughout all of the five states immediately, nor even in all of any one of the states. Pilot projects should start small. At each step, we should have results to determine what to do next.

Second, there must be objective, systematic evaluation of the pilot programs. This Commission expects to have meaningful results from the initial phase of pilot testing by 1997. We will incorporate these results in our final report to Congress. We intend to make an informed recommendation on whether that system should be implemented nationwide, with particular attention to civil liberties and privacy concerns. The features of pilot programs should include:

- **A means by which employers will access the verification system to validate the accuracy of information given by workers.** We received conflicting testimony about the best way to ascertain that a new hire is who he or she claims to be. Some believe that the tamper-resistant driver's licenses now being issued by many states can do the job; others strongly advocate testing a more secure Social Security card.

- But it is also possible that electronic validation through a telephone system would require no document at all. Every ATM system uses a PIN number to protect our money. We should test to see if personal information, such as the mother's maiden name and date of birth, that is already part of the Social Security database, can serve the same function for worksite verification.

- **Measures to ensure the accuracy of the necessary data.** Improvements must be made in both the INS and Social Security Administration databases to ensure that employers have timely and reliable access to what they need. Frankly, no one can be opposed to improving the reliability of the data in these agencies. There is no protection of liberty in government error.

- **Measures to ensure against discrimination.** One key to the Commission's recommendation is that employers would no longer have to ascertain whether a worker is a citizen or an alien, native-born or an immigrant. All workers would have to present the same information to be validated.

- **Measures to protect civil liberties.** Explicit protections should be devised to ensure that the registry is only used for its intended purposes. The Commission believes that electronically validating the Social Security Number could be used to ascertain eligibility for public benefits, without damage to civil liberties, because everyone receiving public assistance must already present a Social Security Number just as they do for work. But the registry is not to be used for routine identification purposes, and there must be penalties for inappropriate use of the verification process. The Commission's unanimous, unequivocal view is that no one should be required to carry a document and produce it on demand to prove their right to be here.

- **Measures to protect privacy.** Explicit provisions also must be built into the system to safeguard individual privacy. The information contained in the registry will be minimal, given its limited purpose. But the Commission is aware that while access to any one piece of information may not be intrusive, in combination with other information, it can lead to privacy violations.

- **Estimates of the start-up time and financial and other costs.** The Social Security Administration made

preliminary estimates for the Commission of its cost for pilot projects: $4 million over the first two years for design and development; and annual costs of maintenance and operation of $32 million. Discrepancies referred to the Social Security Administration were estimated to cost $122 million initially, and $30 million per year thereafter. So the total cost of the registry over five years, according to the Social Security Administration, would be approximately $300 million.

- By way of comparison, the Urban Institute estimates that illegal aliens cost seven states more than $2.1 billion a year. Spending $300 million over five years to save $2 billion each year is a sound investment.

- But the INS cost must be added to the SSA estimate. The Clinton Administration's latest budget request calls for $28.3 million for verification systems pilots, although this also includes the expanded TVS program. The bulk of the INS cost, however, will be cleaning up their own data, which should be done regardless of the pilot projects to improve worksite verification.

- **Specification of the rights, responsibilities and impact on individual workers and employers.** In particular, the Commission recommendation for false negatives is that no one--*no one*--should be fired if their employer does not get a validation code from the registry after hiring. It is entirely possible that a new hire has merely given their Social Security Number wrong. There is no one who has a greater incentive to correct errors, whether they are at the INS or the Social Security Administration, than a legitimate worker who has just learned from the registry that there is a problem. Such problems should be corrected, anyway. I pay into the Social Security system. I want to be sure that the number I have been using is correct. I do not want it misappropriated by an illegal alien.

- **A plan for phasing-in the system.** Pilot projects should test various methods for phasing in improvements in worksite verification, according to the test results.

Objective measures and procedures must be included to determine whether current problems related to fraud, discrimination and excessive paperwork requirements for employers are effectively overcome without imposing undue costs on the government, employers, or employees. The evaluation should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy.

The Commission also recommends reducing the fraudulent access to so-called "breeder documents," particularly birth certificates, that can be used to establish an identity in this country. We recommend these steps:

- Standardized application form for birth certificates;

- Interstate and intrastate matching of birth and death records;

- Only certified copies of birth certificates issued by states should be accepted by federal agencies;

- Standard design and paperstock for all certified copies of birth certificates to reduce counterfeiting;

- Encouraging states to computerize birth records depositories.

The Commission also recommends imposition of greater penalties on those producing or selling fraudulent documents. RICO provisions to facilitate racketeering investigations also should cover conspiracy to produce and sell fraudulent documents.

Those are the Commission's recommendations on worksite verification. They are a part of a comprehensive approach to immigration reform that this Commission is developing. As you know, the Commission has also made recommendations on the national interest in legal immigration to deliver promptly on our top priorities of skilled immigration and uniting nuclear families.

The key to our work so far has been that, through intense discussions and study, we have managed to arrive at a bipartisan consensus. We hope to continue that record in a systematic evaluation of what our immigration policy should be in the twentyfirst century. In that effort, we appreciated this Committee's important role in Congressional

consideration of our work.

I will be glad to answer any questions.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Michael S. Teitelbaum
Acting Co-Chair, U.S. Commission on Immigration Reform
Before the House of Representatives
Committee on the Judiciary
Subcommitte on Immigration and Claims
May 16, 1996

I would like to thank the Subcommittee for inviting the Commission to testify today. As you know, we are a bipartisan Commission. There are now eight members, evenly divided between those appointed by the Republican and Democratic leaderships of the House and the Senate. The Congress has mandated that this Commission examine some of the most contentious issues on the national agenda, and we have tried to do that in a serious, objective, and professional way.

Our recommendations on illegal immigration were unanimous: nine to zero. Those on legal immigration reform were unanimous-less-one: eight to one. It is in that spirit that I would like to focus my own remarks, not only as a member of the Commission, but also as a professional demographer.

The Commission believes that properly-regulated legal immigration serves our national interests in many ways, and it supports the basic framework of current immigration policy based on family unification, employment, and refugee resettlement. But we are convinced that the current legal immigration system is not properly regulated and that it requires major reform to ensure that actual admissions continue to serve our national interest.

At any level of immigration, there are costs as well as benefits. This is particularly true because immigration does not impact uniformly on the nation. The bulk of immigration affects just a handful of states and, in many of those states, it affects particular communities and regions most strongly. And, like many things, much of the costs tend to be immediate while the benefits may take many years or decades.

So it is necessary to strike a balance. We believe that the way to serve the national interest best is first to set priorities--and I know how politically difficult this can be--and then to implement policies that effectively deliver on these priorities.

We did not conclude that the national interest requires substantial immediate cuts in legal immigration. Nor did we see any imperative for increasing legal immigration. The priorities should drive the numbers, not the reverse. As you will hear from my colleague Larry Fuchs in a moment, we believe that the current system simply does not deliver on the nation's top immigration priorities.

We all know that current U.S. immigration law essentially provides both U.S. citizens and recent immigrants with an entitlement to apply for immigrant visas for their foreign family members. Unhappily, this system fails the basic test of truth in advertising. For there is an enormous disparity between the entitlement to apply and the right to receive. The result is truly enormous backlogs.

As you know, this disparity was greatly exacerbated by the 1986 Immigration Reform and Control Act that, due to widespread fraud, ended up legalizing far more illegal aliens than promised (nearly three million). All of these millions of legalized illegal aliens rapidly became entitled to petition for immigrant visas for their family members, in turn producing a skyrocketing backlog of such applications. But it is simply false to argue (as some advocates have done without the slightest embarrassment) that the existence of backlogs is a one-time phenomenon that can be managed without establishing some clear priorities. As you will shortly hear in some detail, unless substantial reforms are implemented by you in the Congress, we can expect very sizeable backlogs to continue--indeed to grow substantially, and indefinitely, into the foreseeable future.

Along with these growing backlogs, we can also expect to see significant increases in the numbers of legal immigrants actually admitted through the remainder of this century. After the turn of the next century, these much higher admissions numbers seem likely to begin to taper down, but to levels that will still be higher than at present. And it's only fair to tell you that this projection of long-term downturn is far less firm than that of the earlier upturn; as in all projections, the further out one goes, the less seriously one should take them.

Overall, I don't find fault with the INS' revised projections of what will happen if the Congress declines to reset immigration priorities. You should expect increased admissions of legal immigrants, up more than 200,000 from the 720,000 recorded in 1995, to about 950,000 two years later (I've allowed a constant 100,000 visas for refugee and asylum admissions, which for some reason are not included in the INS projections), and then tapering downward to levels averaging about 820,000 in the out-years. To paraphrase Mark Twain, news of declining trends in legal immigration has been greatly exaggerated.

What is most important is that, despite these significant increases in the overall level of legal immigration, current policies will also succeed in producing ever-increasing petitions for immigration visas that are unlikely to be available. This policy-by-inaction will produce two highly undesirable results: more separated nuclear families; and continuing and substantial increases in the already unacceptably large and long waiting lists for brothers and sisters, which now stretch out to time scales beyond all acceptability.

The Commission concluded that neither a major increase nor a major decrease in total immigration numbers is needed during the next several years. Over the coming decade, the U.S. can sustain current levels of immigration, that is, about 700,000 per year, without damage or undue costs to our economy or our society. What we determined, however, was that we need to have a major reprioritization of our admission categories.

That is exactly what the Commission recommended--a transfer of visas now used to admit adult children, siblings and "diversity" immigrants into a backlog clearance program to admit more expeditiously those we considered to be the highest priority--spouses and minor children. Once priorities were so reset, and the now-large backlogs in highest priority categories were eliminated, immigration would fall back to the levels we saw only a decade ago, before passage of the 1986 and 1990 immigration acts--about 550,000 admissions per year--and new backlogs would not be created. We recommended further that Congress re-assess immigration levels and priorities every three to five years to allow sensible adjustments as conditions change.

Let me add one personal note. The press stories I have seen suggest that some Members of Congress were angrily surprised to learn late last month that the INS had all along been projecting that the recent declines in legal immigration it was then actively reporting would be quite temporary and soon would reverse themselves into substantial increases. I expect that some of the journalists and editors (at the Washington Post and the Los Angeles Times, for example) who published naive stories about a declining trend in legal immigration--some seemingly based upon the INS press release of March 28, 1996 headlined "U.S. Legal Immigration Down 10.4 Percent in 1995"--may also feel a bit snookered.

The truth is that data on immigration, and the factors that affect them, are very complicated and nuanced critters. Moreover, as a demographer, I know how difficult it is to do intelligent demographic projections and how sensitive these are to choices that must be made about key assumptions. Immigration projections are demographic projections "with bells on," i.e., subject to further uncertainties, such as future trends in naturalization and rates of petitioning by relatives and employers.

For these reasons, I think it would be helpful to the Congress to have some independent means for assessing both current immigration data and alternative projections of future immigration levels and patterns, much the way the Congressional Budget Office provides an independent assessment of budget issues.

I am not sure of what would be the optimal location of such an independent, analytical capacity, which need not be at all large (a single part-time analyst with sophistication would be quite sufficient). It could be in the Congressional Research Service, or in the Congressional Budget Office itself. I do not think it should be a Commission, which has a limited life, nor do I think this sort of scholarly, objective analysis is the sort of thing on which Congressional committees can be expected to devote their very limited in-house staff resources.

But clearly, it is important to plan future immigration policy based on some general knowledge of what current patterns of immigration actually are and what different factors mean for future admissions, including the impact of naturalization on demand for visas in all family-based categories. It would be a very great disservice to the nation if immigration data were to become a matter for dispute or suspicion between the parties or between the Executive and Legislative branches. Perhaps the surest way to avoid that is for Congress to have its own independent source of such expertise.

Thank you for your kind attention.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Lawrence Fuchs
Acting Co-Chair, U.S. Commission on Immigration Reform
Before the House of Representatives
Committee on the Judiciary
Subcommitte on Immigration and Claims
May 16, 1996

I appreciate your asking both the Republican and the Democrat-appointed vice chairs of the Commission to testify today. Although it is impossible in a democracy to keep partisanship wholly out of any major issue in a national debate, we on the Commission, under Barbara Jordan's leadership, have striven to do just that, and I believe we have succeeded.

You have asked us to testify on recent projections for the levels of legal immigration in the next several years. The revised projections that were announced by the INS a few weeks ago are consistent with the basic calculations that this Commission used in making our recommendations on the priorities for legal immigration in June of last year. In a moment, our Executive Director, Susan Martin, will explain the details of the informal projections on which the Commission based our discussions, with particular emphasis on the backlogs for spouses and minor children of legal permanent residents and for the brothers and sisters of U.S. citizens.

The important question to ask about these projections for future immigration is: Do they show that we are delivering on our priorities for legal immigration?

There are two points to be made about the subject of priorities.

First, it is clearly in the national interest--as a matter of priority--to re-unify nuclear families in their new homes in this country as quickly as possible. It is clearly ***not*** in the national interest to keep immigrants in the United States separated from their spouses and minor children. You will hear from Susan Martin's testimony that, without the legal immigration reforms recommended by the Commission, the separation of nuclear families will become a lasting feature of U.S. immigration policy.

Second, as long as our system for legal immigration fails to recognize human nature--that the relationship between spouses and minor children is felt to be closer, and more important, than the relationship between more extended family members--we will encourage illegal immigration.

Indeed, many of the opponents of legal immigration reform in both the House and Senate argued that most of these spouses and minor children are already in the United States. That is true. Some are here illegally. They could have remained separated from husbands, wives, and small children outside the U.S. That would have complied with the law, but it also would have defied human realities. They chose to disobey the law to keep their immediate families together.

Moreover, we should not ignore the rest of the problem. There are more than 300,000 spouses and young children separated by U.S. law, a number that will increase substantially over the next several years unless we take action. They obey the law and so cannot enter the United States as a whole family. Those who are from countries such as India, Korea, and Taiwan cannot even obtain a visitor's visa because of their pending application as immigrants. I hope that this Committee will meet with members of the organization called Professionals for Spousal Reunification. This Commission did, and heard from them about the lengthy separations of husbands and wives living abroad that are imposed by this failure to implement priorities in U.S. law, a failure that serves no national interest whatsoever.

None of this is to say that brothers and sisters and their spouses and children or adult children, whether married or unmarried, are not part of the family. Nor do we say that they are not capable of making important contributions to the U.S. as immigrants. But this is a question of priorities. It is more a question of priorities than of numbers.

As my colleague Michael Teitelbaum just said, the Commission recommended that legal immigration at a level of about 700,000 over the next five to eight years is in the national interest, as long as priorities are established and implemented. The one dissenter to our Commission consensus argued that we could accomplish these goals at current levels or by increasing levels of legal immigration, provided that the siblings and adult children wait longer. But the Commission disagreed by a vote of eight to one.

So as you debate the impact of higher levels of legal immigration, please bear in mind the Commission's view that the critical question is: What are our priorities for legal immigration? It is our view as a Commission that those priorities should dictate the numbers to a considerable extent.

Thank you.

U.S. COMMISSION ON IMMIGRATION REFORM

Last update August 15, 1996

U.S. COMMISSION ON IMMIGRATION REFORM

Testimony of Lawrence Fuchs
Meyer and Walter Jaffee Professor of American Civilization and Politics
Brandeis University
Vice Chair, U.S. Commission on Immigration Reform
Submitted to the U.S. Senate Committee on the Judiciary Subcommitte on Immigration
October 22, 1996

In my testimony, I try to provide a framework for examining the evolution of the essential characteristics of American nationality and citizenship. I will make a few specific recommendations and general comments on strengthening the meaning of citizenship.

There are usually three qualities that make up a sense of nationhood: a founding myth that explains the origins and purpose of the nation; a compelling narrative that tells a story about the core values that emanate from that myth and the heroes and heroines of that story; and finally, rituals that remind the people of that story, embodying the myth, its values, its heroes and heroines, and symbols.

Founding myths, accounting for the origins of a nation and explaining its destiny, usually are tribal (based on genealogy or blood) as with the Abraham story in the Old Testament (God told Abraham to create a new nation) or the tale of Theseus, the mythical Athenian king who defeated the horrible Minotaur of Crete and united twelve small independent states of Attica, making Athens the capital of the new state. The foundation of Rome was attributed to Romulus, son of Mars, the god of war, who, after having been raised with his brother Remus by a she-wolf, conquered the Sabines and built a new city on the Tiber River on the spot where their lives had been saved. Japan, according to its traditional founding myth, was established because a favorite descendent of the Sun Goddess created the Japanese islands and became the first Emperor, from whom all emperors are descended.

Early in its history, spokesmen for the new American nation explained that the U.S. was created as a nation in which individual liberty, opportunity, and reward for individual achievement would prosper. This powerful new myth provided an ideological rationalization for the selfish interest early settlers had in recruiting European immigrants to claim the land, fight Indians, and later to work in the mines and factories. It became the founding myth of a new political culture, uniting white Americans from different religious and national backgrounds, and later others who were not white, in a sense of shared American nationhood. Belief in the myth motivated Americans to create new political institutions and practices that Alexis de Tocqueville, an early nineteenth century French visitor, saw as encouraging a patriotism that grew "by the exercise of civil rights." What he called the "patriotism of a republic" was based on the premise that it is possible to interest men and women in the welfare of their country by making them participants in its government and by so doing to enlist their enthusiastic loyalty to a national community. Here, the feeling of "we-ness" that is usually based on similar physical characteristics, language, or religion (or a combination of them) was replaced by a belief in the myth itself and the values, heroes and heroines, symbols and rituals revolving around the idea of freedom. It was this civic culture that replaced a more tribal culture as a basis of nationhood and appeared to teach men and women to work together with those "who otherwise would have always lived apart."

They myth and its values were embodied in a narrative, beginning with the American Revolution. The narrative tells of the struggle to enlarge freedom for an increasing number of persons regardless of their national origin, color, or religion. It recalls the Civil War, the Second World War against Nazism, the civil rights revolution of the 1960s and 1970s, the continuing immigrant saga, and the successful defense of freedom and democracy against the Soviet Union and its totalitarian system of government.

This American story about the struggle for freedom-freedom sought, freedom thwarted, freedom won, and freedom enlarged-includes oppression, exploitation, and terrible harm against those whom the insiders thought of as outsiders. But the main story line is clear: a long-term expansion of freedom-a continual rebirth of freedom (to use Lincoln's

words), although often interrupted. That sense of continuing renewal is reflected in part in the slogans of the twentieth century activist presidents, such as "The New Freedom" (Wilson), "The New Deal" (Franklin D. Roosevelt), "The Fair Deal" (Truman), "The New Frontier" (Kennedy), "The Great Society" (Johnson), and "The New Beginning" (Reagan). The American story relies heavily on texts that are often treated as though they are sacred: the Declaration of Independence; the Constitution, and especially its Bill of Rights and Fourteenth Amendment; Lincoln's Gettysburg Address and Second Inaugural Address; and Martin Luther King's "I have a dream" speech.

The preamble to the Constitution calls upon Americans to "form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity. . . ." More than any other nation, Americans have emphasized liberty as its central value. Liberty was grounded in what they called the equality of every person under God, a belief asserted in the Declaration of Independence:

We hold these truth to be self evident, that all men [and women] are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are Life, Liberty, and the Pursuit of Happiness.

By emphasizing equal rights in a nation that authorized slavery, the founders introduced a profound moral ambiguity that some argue has not yet been entirely resolved. The idea of equality became as compelling as that of liberty in American political discourse, but its meaning is less clear. Liberty meant freedom from government interference to the founders and still retains essentially that meaning. But what does equality mean? Does it mean social equality, equality under the laws, equality of opportunity, equality of condition-or some combination of them? Equality, in all its many meanings, took on great significance in the rhetoric of public live and social discourse and even in family life in America.

The American narrative is also about the tension between the values of liberty and quality. Much of the debate in American domestic politics is about society's obligation to promote equality of opportunity for those who are born to inherently unequal conditions. Those who are suspicious about public policies that attempt to do that point out that equality of opportunity implies the opportunity to compete with and rise about others and to be rewarded for one's successful efforts. The opposite view holds that without government intervention, equality of opportunity can have little meaning for those born to economically or otherwise disadvantaged circumstances. However, much Americans differ in the debate as to how they should promote equality of opportunity, most of them deeply cherish equality of opportunity as an American value.

In recent years, the political debate has focused increasingly on the role of government in providing equality of opportunity through policies that give particular recognition to the claims of members of groups who have suffered (and many say continue to suffer) restricted opportunity because they are women, African-Americans, or members of other designated minority groups. The very fact that disadvantage is presumed to be a condition that inheres in membership in such groups regardless of one's individual circumstances (health, wealth, education of parents, family situation) has given new meaning to the question of the relationship of the pluribus to the unum. Group membership has become an increasingly powerful way of defining individual identity, and public policies now go beyond equality under the law in recognizing gender, color, and national origin as a basis for what is usually called affirmative action regardless of individual circumstances. In addition, some members of groups designated as disadvantaged claim a status of inherited victimization that deepens their sense of grievance against the political and economic system that they see as dominated by white males. As a result, much of the current debate about multiculturalism revolves around their insistence on having their separateness acknowledged and affirmed in public policy generally, including education. Some, including even white males, reject the idea of a common culture, even a common political culture, as long as members of certain groups cannot show aggregate (group) results in economic, educational, and political attainment equal to that of white males.

Others see in this view of American life a danger to the value of liberty itself. They ask what freedom means if not the freedom to assert one's individuality regardless of inherited group status. What does it mean unless one is free to cross group boundaries regardless of one's color or inherited religion or nationality? What, they ask, will happen under the strains of increasing diversity if those who live, work, and vote in this country begin to think of themselves first and foremost as members of separate groups and not as Americans?

My own view is more optimistic than these questions imply. I agree with those who believe that the tension between the claims of the pluribus and the requirements of the unum can be resolved in a nation that values both liberty and equality, but only if we pay at least as much attention to the requirements of the unum as to the histories, sensibilities, and claims of the pluribus.

I think that serious scholars of this subject of Americanization are in virtually unanimous agreement that civic virtue and good citizenship in the United States has nothing to do with race or ethnicity, despite the burgeoning claims of polemicists to the contrary. That conclusion is demonstrated overwhelmingly by the evidence during these past 250 years. To argue that whites or Anglo-Americans have been more devoted to principles of liberty and justice for all flies in the face of the facts.

American values are accessible to anyone, regardless of race, religion, or ancestral background, precisely because our most important principle is the equal protection of the laws for all, regardless of race, religion, or national origin. That is the genius of the system, which must be protected and nourished.

A robust idea of American citizenship depends on a widespread understanding and appreciation-and even celebration-of the American constitutional system, its symbols and rituals, its heroes and heroines.

I believe there are several things that can be done to encourage that robust sense of citizenship for native-born and naturalized citizens. Here are six of them:

- First, an all-out commitment to the renewal of American civic education in our schools and communities;
- Second, a steady modification and ultimate abandonment of the dangerous notion of group rights as embodied in the harder forms of affirmative action, including abandonment by the year 2010 of the current racial categories in the U.S. census;
- Third, an all-out commitment to use the best pedagogic methods available to make certain that no one graduates from eighth grade without being able to speak, read, and write English effectively;
- Fourth, an expanded commitment for English language training for adults who need and want it;
- Fifth, a change in our naturalization oath and naturalization requirements, making the oath simpler and more appropriate, and making the requirements more meaningful;
- Sixth, a stronger commitment than ever to making equality of the laws and equality of opportunity real for the poorest and otherwise most vulnerable of our citizens.

What do I mean by a commitment to civic education? I believe the Secretary of Education should call a conference of state educational leaders to examine the possibility of developing a common core civic curriculum. I don't mean curriculum just for one grade level in a civics course, although that could and should be a part of it. I mean that our schools should teach the essential of American history and constitutional principles repeatedly at different grade levels in appropriate ways. I also mean that the Pledge of Allegiance should be recited and discussed. What does the goal of liberty and justice for all mean? What do we mean by majority rule and individual rights?

I mean putting the pictures of George Washington, Abraham Lincoln, and Franklin Delano Roosevelt back on the schoolroom walls and teaching how their roles in the Revolution, the Civil War, and World War II relate to the Declaration of Independence, Lincoln's Gettysburg Address, and FDR's Four Freedoms in the American search to expand the meaning of liberty and justice for all.

I mean a curriculum that nourishes civic virtue in action by including community service, as a number of schools now do. I mean a curriculum that encourages all Americans, not just those in the schools, to think about the meaning of Independence Day, Thanksgiving, Memorial Day, and Martin Luther King's birthday. And whatever happened to "I Am An American Day?" Lets bring it back. What a wonderful occasion for naturalization ceremonies, community service, and local competition for young essayists to say what being an American means to them.

Throughout most of American history, Independence Day, July 4th, was the most important national holiday. Different ethnic groups often combined their celebration of American independence and the and the values of American life in their own particular way. In the 1880s in Worcester, Massachusetts, the Ancient Order of the Hibernians, an Irish

nationalist society, held a picnic on July 4th in which the exuberance of the Irish served both as a preservation of Irish customs and a defense of American freedoms. Independence Day in Worcester in the 1890s attracted a large proportion of the Swedish-American population, who began with services at one of eight Swedish Protestant churches and ended at the picnic with patriotic speeches, sometimes in Swedish. All the ethnic groups of Worcester used Independence Day as an opportunity to express their own ethnic identity even as they celebrated American freedoms.

As new immigrant-ethnic groups claimed an American identity for themselves, a great many Anglo-Saxon Protestants, particularly in New England, thought of Independence Day as their special holiday. When President Ulysses S. Grant and key members of his cabinet joined the centennial celebration of the beginning of the American revolution at Concord and Lexington, Massachusetts, on April 19, 1875, they listened to speeches made only by illustrious Anglo-Americans, including some of the great poets of New England. The master of ceremonies of the festive day in Lexington reminded the audience that all of the foreign heroes at Lexington and Concord had English names.

Then the Anglo-Americans, especially in New England, thought of themselves as the charter members of the Republic. Americans from other backgrounds were relative newcomers, and persons of color were still treated essentially as outsiders by those who held governmental and economic power, despite the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution. A few years after the centennial, their position as outsiders would be more sharply defined. Blacks in the south would be subjugated, for the most part, to a segregated rural working class-sharecroppers, for the most part. Chinese laborers would be excluded from immigrating to the United States, and an Act was passed in 1887 by the Congress to break up native American Indian lands and assimilate the Indians.

One hundred years later, the bicentennial of the Revolution was celebrated by emphasizing American diversity. That was also true of the centennial of the Statue of Liberty, the bicentennial of the Constitution, and the celebration of the restoration of Ellis Island. Ethnicity had become central to the American story-to the way Americans looked at themselves and presented themselves to the world. On the mall of the nation's capital on July 4th, 1983, the National Symphony was conducted by a Russian refugee, Mstlav Rostropovich, who played the distinctive American music of Jewish-American composers George Gerswhin and Aaron Copeland. Arias from Porgy and Bess were sung by the great American black singer, Leontyne Price. "A Lincoln Portrait" was narrated by the black American baseball player Willie Stargell. Newcomer Americans from at least two dozen Asian, African, and Latin American countries tapped and drummed to "The Star and Stripes Forever," composed by the Portuguese-American, John Philp Sousa.

The Fourth of July emphasizes national independence and personal freedom. Thanksgiving, which has become the other major holiday of America's civic culture, also offers an opportunity for celebrating e pluribus unum. The theme of Thanksgiving, proclaimed by George Washington in 1789 and again by President Lincoln in 1863 as a national holiday memorializing the 1621 feast of thanks given by Pilgrims (who did not call themselves Pilgrims or wear tall hats or black suits with wide collars or eat turkey) at Plymouth, still retained a more or less religious appreciation of the benefits of freedom and opportunity in the U.S. But in the 1970s and 1980s, Thanksgiving became another occasion for the celebration of ethnic diversity. In 1976, The New York Times told of an Italian family who ate a Thanksgiving dinner as they imagined Columbus might have had. A Russian-American family featured a Russian dessert made from cranberries; a Chinese-American family ate Peking duck instead of turkey; and an Austrian-American family feasted on braised turkey and white beans. A Boston Globe story in 1985 told of Cambodians, Vietnamese, and Laotians celebrating Thanksgiving at a feast sponsored by the Jewish Vocational Service. There, the refugee families ate fiery nuk chau sauce and cha gio egg rolls along with their roast turkey, cranberry sauce, and pumpkin pie.

By 1986, a writer for The New York Times concluded that "as an American holiday, Thanksgiving's universality must lie in its ability to welcome succeeding generation of immigrant to these shores." She wrote of Haitians, Barbadians, Jamaicans, Panamanians, and Trinidadians sitting down with family members for dinners that merged the culinary traditions of their homeland cultures with those of the more traditional Thanksgiving. "For me," reported one second-generation American of West Indian background, "Thanksgiving is a mixing of the black-American traditions with the Caribbean."

A civic education curriculum does not denigrate ethnic and religious diversity in the United States. Far from it. It honors it and even celebrates it. But it would not permit, as now occurs in many universities and some high schools, the encouragement of ethnocentrism in the name of multiculturalism.

I will skip a discussion my second point-the question of group rights as I have written about it extensively elsewhere. There has been a tendency in American public discourse to speak of group rights as though they were civil rights. Civil rights apply to individuals. We have no place in our constitutional system for group rights, except for native American Indians and possibly ethnic Hawaiians, Aleuts, and Eskimos.

The importance of English seems self-evident. The more linguistically capable Americans are, the better. But English is a must for anyone to participate substantially in the national political community or the enter the competition for opportunities in a vast continental and global economy. English is an important sign of national identity. My immigrant, orphan, illiterate grandmother could not write English or any other language until the day she died, and she was a magnificent human being who raised eight dedicated, patriotic Americans. But her limited knowledge of English restricted her chances-she never held any job except that of maid-and cut her off from many aspects of American life. We need a national volunteer effort not just to teach children English, as called for by President Clinton, but also to expand English teaching resources for adult immigrants and refugees.

The next recommendation-improving the naturalization test-is one I have not written or testified about before. The present naturalization oath includes archaic language that takes away from its meaning. It reads:

I hereby declare, on oath, that I absolutely and entirely renounce and abjure all allegiance and fidelity to any foreign prince, potentate, state, or sovereignty, of whom or which I have heretofore been a subject or citizen; that I will support and defend the Constitution and laws of the United States of America against all enemies, foreign and domestic; that I will bear truth and allegiance to the same; that I will bear arms on behalf of the United States when required by the law; that I will perform noncombattant service in the armed forces of the United States when required by the law; that I will perform work of national importance under civilian direction when required by the law; and that I take this obligation freely without any mental reservation or purpose of evasion; so help me God.

It is amazing that the oath has held up as long as it has. But surely we can do something about such archaic language as "abjure" and "fidelity to any foreign prince, potentate." One possibility would be:

I, (name), take this solemn oath (or "make this solemn affirmation) freely and without mental reservation or purpose of evasion. My allegiance is to the United States of America above any other nation. I promise to support and honor the Constitution and laws of my new country and their principles of liberty and justice for all. I pledge to defend them by force of arms, noncombatant military service, or civilian work of national importance if necessary.

One might suspect that I am in favor of making naturalization easier by recommending a change in language. That is not the case. I want the naturalization oath to be understood. I am concerned about any tendency to reduce further the civic education and English language requirements for naturalization. There is considerable evidence that the naturalization ceremony, when done with dignity, stimulates feelings of patriotic loyalty for newcomer citizens around basic values of liberty and equality of opportunity. Newspaper accounts of naturalization swearing-in ceremonies repeatedly tell of the enthusiasm with which these new citizens embrace them. A Russian-Jewish refugee from Kiev, who was one of ninety-seven immigrants from twenty-eight countries sworn in as U.S. citizens at the Monticello home of Thomas Jefferson, told a television reporter after his naturalization ceremony: "I believe the most important thing that brought me to this country is the dream about the future of my kids, to grow them in a free country, to be independent, to be whatever they want. . . . The United States. My land of opportunity." Another immigrant, this one from Vietnam, told a reporter after the same ceremony: ". . . this is the best place . . . this is the best opportunity, in America." In El Paso, Texas, a new Trinidadian-American said: "We feel there are more opportunities here for us and our family . . ."

Freedom to work and make a living is one of the inducements to become an American citizen. But the speeches made by those who preside over naturalization ceremonies usually stress the importance of other freedoms. At many ceremonies, naturalized citizens are given a copy of the Bill of Rights. And many new citizens respond. A newly-naturalized, Cuban-American told reporters that becoming an American is the greatest thing "because here we can have what everyone should have, and that means our human rights. In short, freedom."

We need to mobilize volunteer resources to support the naturalization work of the INS. I believe the presidential leadership, with presidential leadership, with the cooperation of governors, mayors, civic and service organizations,

universities, corporations, and labor unions, we can process naturalization expeditiously without demeaning its significance. Panels of distinguished Americans from various walks of life can be enlisted as accredited volunteers to participate in managing naturalization ceremonies.

I also believe we should consider requiring a variety of standardized written civics and history tests in English for passing of the naturalization exam. This would cut down the time used in oral interviews and elevate the significance of passing the exam by making standards more uniform. Exceptions could be made for compassionate reasons, as they are now.

I will conclude by saying that if people living in poverty had heard my remarks up to this point, they would be likely to think them utterly irrelevant to their own lives. Jacob Riis examined the relationship of civic virtue and citizenship to poverty in 1902 in his book The Battle with the Slum. He wrote that where the slum flourishes unchallenged in the cities, "citizen virtue," as a he called it, is starved. It is not enough, he wrote, to repeat that all men are created equal.

So let us remember that citizenship does not flourish in mean streets where unemployment, drive-by shootings and crack cocaine are widespread. Nor is civic virtue helped by a hostile reception to immigrants. It does nothing to cultivate a robust ideal of citizenship to categorically deny safety net welfare benefits to legal immigrants who need them through no fault of their own or of their sponsors. Nor will civic virtue be promoted by denial of a public school education to the children illegal aliens or by the modification of birthright citizenship.

Why do we care so much about citizenship in U.S.? I think it is because we were the first nation to say that citizenship is not a question of complying with the wishes of the sovereign or a matter of blood. It is entirely voluntary. No government can force it on you or take it away unless you lied to get it. It is a matter of our free will. That revolutionary idea is at the heart of our experiment in self government. We believe that ordinary women and men, regardless of their ancestry, can make a democratic republic work. This is not just an abstract issue: too much blood has been spilt in order to make this idea a reality to everyone born in this country, regardless of race, ancestry, religion, or economic circumstances.

Some of my friends are extremely worried about the fact that our constitutional system permits dual citizenship. I urge them to keep in mind that loyalty cannot be compelled. The loyalty of subjects may be compelled, but not that of totally free citizens. The power to win loyalty in this culture of voluntary citizenship has been demonstrated many times in American history. Witness the extraordinary record of Japanese-Americans in the 442nd regimental combat team in World War II. Note the story of Sergeant Jimmy Lopez, one of the American hostages held by Iran in 1980, who wrote on the wall where he was imprisoned: "Viva el rojo, blanco e azul!" (Long live the red, white, and blue). Tell your grandchildren the story of Guy Gabald�n a Mexican-American who won the silver star in the Second World War. Raised in East Los Angles by a Japanese-American family who taught him to speak Japanese fluently, he won the medal for persuading one thousand Japanese soldiers to surrender during the battle for the island of Saipan.

These stories illustrate the strength of our civic culture. But they do not mean we can be complacent. The civil culture must be nourished. Attention must be paid. And Senator Simpson, you should be congratulated for doing just that.

U.S. COMMISSION ON IMMIGRATION REFORM

1 9 9 7
REPORT TO CONGRESS
EXECUTIVE SUMMARY

Becoming an American: Immigration and Immigrant Policy

INTRODUCTION

Immigration and immigrant policy is about immigrants, their families and the rest of us. It is about the meaning of American nationality and the foundation of national unity. It is about uniting persons from all over the world in a common civic culture.

The process of becoming an American is most simply called "Americanization," which must always be a two-way street. All Americans, not just immigrants, should understand the importance of our shared civic culture to our national community. This final report of the U.S. Commission on Immigration Reform makes recommendations to further the goals of Americanization by setting out *immigrant* policies to help orient immigrants and their new communities, to improve educational programs that help immigrants and their children learn English and civics, and to reinforce the integrity of the naturalization process through which immigrants become U.S. citizens.

This report also makes recommendations regarding *immigration* policy. It reiterates the conclusions we reached in three interim reports-on unlawful migration, legal immigration, and refugee and asylum policy-and makes additional recommendations for reforming immigration policies. Further, in this report, the Commission recommends ways to improve the structure and management of the federal agencies responsible for achieving the goals of immigration policy. It is our hope that this final report *Becoming An American: Immigration and Immigrant Policy*, along with our three interim reports, constitutes a full response to the work assigned the Commission by Congress: to assess the national interest in immigration and report how it can best be achieved.

MANDATE AND METHODS

Public Law 101-649, the Immigration Act of 1990, established this Commission to review and evaluate the impact of immigration policy. More specifically, the Commission must report on the impact of immigration on: the need for labor and skills; employment and other economic conditions; social, demographic, and environmental impact of immigration; and impact of immigrants on the foreign policy and national security interests of the United States. The Commission engaged in a wide variety of fact-finding activities to fulfill this mandate. Site visits were conducted throughout the United States. Commission members visited immigrant and refugee communities in California, Texas, Florida, New York, Massachusetts, Illinois, Arizona, Washington, Kansas, Virginia, Washington, DC, Puerto Rico and the Commonwealth of the Northern Mariana Islands. We also visited such major source countries as Mexico, the Dominican Republic, Cuba, Haiti, and the Philippines. To increase our understanding of international refugee policy issues, we visited Bosnia, Croatia, Germany, and Kenya, and we consulted with Geneva-based officials from the U.N. High Commission for Refugees and the International Organization for Migration. We held more than forty public hearings, consultations with government and private sector officials, and expert roundtable discussions.

IMMIGRATION TODAY

The effects of immigration are numerous, complex, and varied. Immigrants contribute in many ways to the United States: to its vibrant and diverse communities; to its lively and participatory democracy; to its vital intellectual and cultural life, to its renowned job-creating entrepreneurship and marketplaces; and to its family values and hard-work ethic. However, there are costs as well as benefits from today's immigration. Those workers most at risk in our restructuring economy low-skilled workers in production and service jobs are those who directly compete with today's low-skilled immigrants. Further, immigration presents special challenges to certain states and local communities that disproportionately bear the fiscal and other costs of incorporating newcomers.

Properly-regulated immigration and immigrant policy serves the national interest by ensuring the entry of those who will contribute most to our society and helping lawful newcomers adjust to life in the United States. It must give due consideration to shifting economic realities. A well-regulated system sets priorities for admission; facilitates nuclear family reunification; gives U.S. employers access to a global labor market while ensuring that U.S. workers are not displaced or otherwise adversely affected; and fulfills our commitment to resettle refugees as one of several elements of humanitarian protection of the persecuted.

U.S. COMMISSION ON IMMIGRATION REFORM

1 9 9 7
REPORT TO CONGRESS
EXECUTIVE SUMMARY

Becoming an American: Immigration and Immigrant Policy

AMERICANIZATION AND INTEGRATION OF IMMIGRANTS

A DECLARATION OF PRINCIPLES AND VALUES

Immigration to the United States has created one of the world's most successful multiethnic nations. We believe these truths constitute the distinctive characteristics of American nationality:

- American unity depends upon a widely-held belief in the principles and values embodied in the American Constitution and their fulfillment in practice: equal protection and justice under the law; freedom of speech and religion; and representative government;
- Lawfully admitted newcomers of any ancestral nationality without regard to race, ethnicity, or religion truly become Americans when they give allegiance to these principles and values;
- Ethnic and religious diversity based on personal freedom is compatible with national unity; and
- The nation is strengthened when those who live in it communicate effectively with each other in English, even as many persons retain or acquire the ability to communicate in other languages.

As long as we live by these principles and help newcomers to learn and practice them, we will continue to be a nation that benefits from substantial but well-regulated immigration. We must pay attention to our core values, as we have tried to do in our recommendations throughout this report. Then, we will continue to realize the lofty goal of *E Pluribus Unum*.[2]

AMERICANIZATION

The Commission reiterates its call for the Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy and equal opportunity. The United States has fought for the principles of individual rights and equal protection under the law, notions that now apply to all our residents. We have long recognized that immigrants are entitled to the full protection of our Constitution and laws. And, the U.S. has the sovereign right to impose obligations on immigrants.

In our 1995 report to Congress, the Commission called for a new commitment to Americanization. In a public speech that same year, Barbara Jordan, our late chair, noted: "That word earned a bad reputation when it was stolen by racists and xenophobes in the 1920s. But it is our word, and we are taking it back." Americanization is the process of integration by which immigrants become part of our communities and by which our communities and the nation learn from and adapt to their presence. Americanization means the civic incorporation of immigrants, that is the cultivation of

a shared commitment to the American values of liberty, democracy, and equal opportunity.

The Commission proposes that the principles of Americanization be made more explicit through the covenant between immigrant and nation. Immigrants become part of us, and we grow and become all the stronger for having embraced them. In this spirit, the Commission sees the covenant as:

- ***Voluntary.*** Immigration to the United States ﷺa benefit to both citizens and immigrantsﷺ is not an entitlement and Americanization cannot be forced.

- ***Mutual and Reciprocal.*** Immigration presents mutual obligations. Immigrants must accept the obligations we imposeﷺto obey our laws, to pay taxes, to respect other cultures and ethnic groups. At the same time, citizens incur obligations to provide an environment in which newcomers can become fully participating members of our society.

- ***Individual, Not Collective.*** The United States is a nation founded on the proposition that each individual is born with certain rights and that the purpose of government is to secure these rights. The United States admits immigrants as individuals (or individual members of families). As long as the United States continues to emphasize the rights of individuals over those of groups, we need not fear that the diversity brought by immigration will lead to ethnic division or disunity.

To help achieve full integration of newcomers, the Commission calls upon federal, state, and local governments to provide renewed leadership and resources to a program to promote Americanization that requires:

- Developing capacities to orient both newcomers and receiving communities;

- Educating newcomers in English language skills and our core civic values; and

- Revisiting the meaning and conferral of citizenship to ensure the integrity of the naturalization process.

ORIENTATION

The Commission recommends that the federal, state, and local governments take an active role in helping newcomers become self-reliant: orienting immigrants and receiving communities as to their mutual rights and responsibilities, providing information they need for successful integration, and encouraging the development of local capacities to mediate when divisions occur between groups. Information and orientation should be provided both to immigrants and to their receiving communities.

The Commission believes the federal government should help immigrants and local communities by:

- Giving orientation materials to legal immigrants upon admission that include, but are not limited to: a welcoming greeting; a brief discussion of U.S. history, law, and principles of U.S. democracy; tools to help the immigrant locate and use services for which they are eligible; and other immigration-related information and documents. All immigrants would receive the same materials. The packets would be available in English and other dominant immigrant languages.

- Encouraging state governments to establish information clearinghouses in major immigrant receiving communities. The Commission recommends that the federal government provide modest incentive grants to states to encourage them to establish and maintain local resources that would provide information to immigrants and local communities.

- Promoting public/private partnerships to orient and assist immigrants in adapting to life in the United States. While the federal government makes the decisions about how many and which immigrants will be admitted to the

United States, the actual process of integration takes place in local communities. Local government, schools, businesses, charities, foundations, religious institutions, ethnic associations, and other groups play important roles in the Americanization process.

EDUCATION

Education is the principal tool of Americanization. Local educational institutions have the primary responsibility for educating immigrants. However, there is a federal role in promoting and funding English language acquisition and other academic and civic orientation for both immigrant children and adults.

The Commission urges a renewed commitment to the education of immigrant children. The number of school-aged children of immigrants is growing and expected to increase dramatically. These children, mostly young, speak more than 150 different languages; many have difficulty communicating in English. They are enrolled in public schools as well as in secular and religious private schools throughout the country. And, in addition to the problems other students have, they face particular problems in gaining an education often because of language difficulties.

The Commission emphasizes that rapid acquisition of English should be the paramount goal of any immigrant language instruction program. English is the most critical of basic skills for successful integration. English can be taught to children in many ways. Effective programs share certain common characteristics. Based on a review of these programs, the Commission emphasizes the need for public and private educational programs to:

- Conduct regular evaluations of students' English competence and their ability to apply it to academic subjects. Such evaluations will ensure placement of immigrant children into regular English-speaking classes as soon as they are prepared. Regular evaluation also will highlight strengths and weaknesses in educational programs and provide insight on improvements that are needed to ensure timely English acquisition.

- Collect and analyze data on immigrant students, including their linguistic and academic performance and the efficacy of the instructional methods used in programs for immigrant children.

- Include appropriate grade-level instruction in other academic disciplines. Coordination with teachers, curricula, and instruction outside of English acquisition will promote students' mastery of regular subject matter while they expeditiously learn English.

- Involve parents of immigrant students in their schooling. A characteristic of many of the most successful language acquisition programs is the active involvement of parents in the education of their children.

The Commission encourages programs that are responsive to the needs of immigrant children and an orientation to United States school systems and the community,such as we have seen in "newcomer schools." Newcomer schools must not isolate immigrant newcomers. Instead, they must be transitional and actively promote the timely integration of students into mainstream schools.

The Commission recommends the revival and emphasis on instruction of all kindergarten through grade twelve students in the common civic culture that is essential to citizenship. An understanding of the history of the United States and the principles and practices of our government are an essential for all students, immigrants and natives alike. Americanization requires a renewed emphasis on the common core of civic culture that unites individuals from many ethnic and racial groups.

The Commission emphasizes the urgent need to recruit, train, and provide support to teachers who work with immigrant students. There is a disturbing shortage of qualified teachers for children with limited English proficiency, of teacher training programs for producing such teachers, and of other support for effective English acquisition instruction.

The Commission supports immigrant education funding that is based on a more accurate assessment of the impact of

immigration on school systems and that is adequate to alleviate these impacts. There are costs and responsibilities for language acquisition and immigrant education programs that are not now being met. We urge the federal government to do its fair share in meeting this challenge. The long-term costs of failure in terms of dropouts and poorly educated adults will be far larger for the nation and local communities than the costs of such programs. More specifically, we urge the federal government to:

- Provide flexibility in federal funding for the teaching of English to immigrant students to achieve maximum local choice of instructional model.The federal government should not mandate any one mode of instruction (e.g., bilingual education, English as a second language programs, immersion).

- Make funding contingent on performance outcomes—that is, English language acquisition and mastery of regular academic subject matter by students served in these programs. School systems receiving funds because of large numbers of children with limited English proficiency and immigrant children should be held to rigorous performance standards. Federal and state funding incentives should promote—not impede—expeditious placement in regular, English-speaking classes.

The Commission urges the federal, state, and local governments and private institutions to enhance educational opportunities for adult immigrants. Education for basic skills and literacy in English is the major vehicle that integrates adult immigrants into American society and participation in its civic activities. Literate adults are more likely to participate in the workforce and twice as likely to participate in our democracy. Literate adults foster literacy in their children, and parents' educational levels positively affect their children's academic performance.

Adult education is severely underfunded. Available resources are inadequate to meet the demand for adult immigrant education, particularly for English proficiency and job skills. In recognition of the benefits they receive from immigration, the Commission urges leaders from businesses and corporations to participate in skills training, English instruction, and civics education programs for immigrants. Religious schools and institutions, charities, foundations, community organizations, public and private schools, colleges and universities also can contribute resources, facilities, and expertise.

NATURALIZATION

Naturalization is the most important act that a legal immigrant undertakes in the process of becoming an American. Taking this step confers upon the immigrant all the rights and responsibilities of civic and political participation that the United States has to offer (except to become President). The naturalization process must be credible, and it must be accorded the formality and ceremony appropriate to its importance.

The Commission believes that the current legal requirements for naturalization are appropriate, but improvements are needed in the means used to measure whether an applicant meets these requirements. With regard to the specific legal requirements, the Commission supports:

- Maintaining requirements that legal immigrants must reside in the United States for five years (three years for spouses of U.S. citizens and Lawful Permanent Residents [LPRs] who serve in the military) before naturalizing. We believe five years is adequate for immigrants to embrace, understand, and demonstrate their knowledge of the principles of American democracy.

- Improving the mechanisms used to demonstrate knowledge of U.S. history, civics, and English competence. The Commission believes that the tests used in naturalization should seek to determine if applicants have a meaningful knowledge of U.S. history and civics and are able to communicate in English. The tests should be standardized and aim to evaluate a common core of information to be understood by all new citizens.

- Expediting swearing-in ceremonies while maintaining their solemnity and dignity. In districts where the federal court has exercised sole jurisdiction to conduct the swearing-in ceremonies, long delays often result from crowded

court calendars. The Commission recommends that Congress restore the Executive Branch's sole jurisdiction for naturalization to reduce this waiting time. The Executive Branch should continue to work with federal judges as well as other qualified institutions, such as state courts and Immigration Judges, to ensure that swearing-in ceremonies are consistently conducted in a timely, efficient, and dignified manner.

- Revising the naturalization oath to make it comprehensible, solemn, and meaningful. The current oath is not easy to comprehend. We believe it is not widely understood by new citizens. Its wording includes dated language, archaic form, and convoluted grammar. The Commission proposes the following revision of the oath as capturing the essence of naturalization.

> *Solemnly, freely, and*
> *without any mental reservation,*
> *I, [name] hereby renounce under oath*
> *[or upon affirmation]*
> *all former political allegiances.*
> *My sole political fidelity*
> *and allegiance from this day forward*
> *is to the United States of America.*
> *I pledge to support and respect*
> *its Constitution and laws.*
> *Where and if lawfully required,*
> *I further commit myself to defend them against all enemies,*
> *foreign and domestic, either by military or civilian service.*
> *This I do solemnly swear [or affirm].*

The Commission calls for urgently needed reforms to increase the efficiency and integrity of the naturalization process. The vast majority of applicants for naturalization are law-abiding immigrants who contribute to our society. The value of Americanization is eroded whenever unnecessary obstacles prevent eligible immigrants from becoming citizens. Its value also is undermined when the process permits the abuse of our laws by naturalizing applicants who are not entitled to citizenship.

Recognizing steps already are underway to reengineer the naturalization process, the Commission supports the following approaches:

- Instituting efficiencies without sacrificing quality controls. In the Commission's 1995 report to Congress, we recommended that the Immigration and Naturalization Service [INS] and the Congress take steps to expedite the processing of naturalization applications while maintaining rigorous standards. Two years later, the naturalization process still takes too long, and previous efforts to expedite processing resulted in serious violations of the integrity of the system. Instituting a system that is both credible and efficient remains a pressing need.

- Improving the integrity and processing of fingerprints. The Commission believes that only service providers under direct control of the federal government should be authorized to take fingerprints. If the federal government does not take fingerprints itself but instead contracts with service providers, it must screen and monitor such providers rigorously for their capacity, capability, and integrity. Failure to meet standards would mean the contract would be terminated.

- Contracting with a single English and civics testing service. The Commission recommends that the federal government contract with one national and respected testing service to develop and administer the English and civics tests to naturalization applicants. Having one organization under contract should help the government substantially improve its oversight. Moreover, contracting with a highly-respected and nationally-recognized testing service will help ensure a high-quality product.

- Increasing professionalism. While many naturalization staff are highly professional in carrying out their duties, reports from district offices, congressional hearings, and complaints from naturalization applicants demonstrate continued dissatisfaction with the quality of naturalization services. Recruitment and training of longer-term staff

assigned to adjudicating applications and overseeing quality control would help overcome some of these problems.

- Improving automation. The Commission is encouraged by plans to develop linkages among data sources related to naturalization. The Commission recommends continued funding for an up-to-date, advanced, electronic automation system for information entry and recordkeeping.

- Establishing clear fee-waiver guidelines and implementing them consistently. Under current law, the Attorney General is authorized to grant fee waivers to naturalization applicants. The Commission has received accounts of legitimate requests being denied. Clear guidelines and consistent implementation are needed to ensure that *bona fide* requests are granted, while guarding against abuse.

[2] Our national motto, E Pluribus Unum, "from many, one," was originally conceived to denote the union of the thirteen states into one nation. Throughout our history, *E Pluribus Unum* has also come to mean the vital unity of our national community founded on individual freedom and the diversity that flows from it.

U.S. COMMISSION ON IMMIGRATION REFORM

1 9 9 7
REPORT TO CONGRESS
EXECUTIVE SUMMARY

Becoming an American: Immigration and Immigrant Policy

FRAMEWORK FOR IMMIGRATION POLICY

In our previous reports, the Commission defined a credible immigration policy "by a simple yardstick: people who should get in do get in, people who should not get in are kept out; and people who are judged deportable are required to leave." By these measures, we have made substantial, but incomplete, progress. What follows are the Commission's recommendations for comprehensive reform to achieve more fully a credible framework for immigration policy.

LEGAL PERMANENT ADMISSIONS

The Commission reiterates its support for a properly-regulated system for admitting lawful permanent residents.[3] Research and analyses conducted since the issuance of the Commission's report on legal immigration support our view that a properly-regulated system of legal permanent admissions serves the national interest. The Commission urges reforms in our legal immigration system to enhance the benefits accruing from the entry of newcomers while guarding against harms, particularly to the most vulnerable of U.S. residents—those who are themselves unskilled and living in poverty. More specifically, the Commission reiterates its support for:

- **A significant redefinition of priorities and reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration policy.** The current framework for legal immigration—family, skills, and humanitarian admissions—makes sense. However, the statutory and regulatory priorities and procedures for admissions do not adequately support the stated intentions of legal immigration—to reunify families, to provide employers an opportunity to recruit foreign workers to meet labor needs, and to respond to humanitarian crises around the world. During the two years since our report on legal immigration, the problems in the legal admission system have not been solved. Indeed, some of them have worsened.

  Current immigration levels should be sustained for the next several years while the U.S. revamps its legal immigration system and shifts the priorities for admission away from the extended family and toward the nuclear family and away from the unskilled and toward the higher-skilled immigrant. Thereafter, modest reductions in levels of immigration —to about 550,000 per year, comparable to those of the 1980s— will result from the changed priority system. The Commission continues to believe that legal admission numbers should be authorized by Congress for a specified time (e.g., three to five years) to ensure regular, periodic review and, if needed, change by Congress. This review should consider the adequacy of admission numbers for accomplishing priorities.

- **Family-based admissions that give priority to nuclear family members—spouses and minor children of U.S. citizens, parents of U.S. citizens, and spouses and minor children of lawful permanent residents—and include a backlog clearance program to permit the most expeditious entry of the spouses and minor children of LPRs.** The Commission recommends allocation of 550,000 family-based admission numbers each year until the large backlog of spouses and minor children is cleared. Numbers going to lower priority categories

(e.g., adult children, siblings, and diversity immigrants), should be transferred to the nuclear family categories. Thereafter Congress should set sufficient admission numbers to permit all spouses and minor children to enter expeditiously.

Since the Commission first reported its findings on legal admission, the problems associated with family-based admissions have grown. In 1995, the wait between application and admission of the spouses and minor children of LPRs was approximately three years. It is now more than four and one-half years and still growing. Moreover, various statutory changes made in 1996 make it all the more important that Congress take specific action to clear the backlog quickly to regularize the status of the spouses and minor children of legal permanent residents in the United States. In an effort to deter illegal migration, Congress expanded the bases and number of grounds upon which persons may be denied legal status because of a previous illegal entry or overstay of a visa. An unknown, but believed to be large, number of spouses and minor children of LPRs awaiting legal status are unlawfully present in the United States. While the Commission does not condone their illegal presence, we are cognizant of the great difficulties posed by the long waiting period for a family second preference visa.

- **Skill-based admissions policies that enhance opportunities for the entry of highly-skilled immigrants, particularly those with advanced degrees, and eliminate the category for admission of unskilled workers.** The Commission continues to recommend that immigrants be chosen on the basis of the skills they contribute to the U.S. economy. Only if there is a compelling national interest—such as nuclear family reunification or humanitarian admissions—should immigrants be admitted without regard to the economic contributions they can make.

  Research shows that education plays a major role in determining the impacts of immigration. Immigration of unskilled immigrants comes at a cost to unskilled U.S. workers, particularly established immigrants for whom new immigrants are economic substitutes. Further, the difference in estimated lifetime fiscal effects of immigrants by education is striking: using the same methodology to estimate net costs and benefits, immigrants with a high school education or more are found to be net contributors while those without a high school degree continue to be net costs to taxpayers throughout their lifetime.[4]

  The Commission also continues to recommend changes in the procedures used in testing the labor market impact of employment-based admissions. Rather than use the lengthy, costly, and bureaucratic labor certification system, the Commission recommends using market forces as a labor market test. To ensure a level playing field for U.S. workers, employers would attest to having taken appropriate steps to recruit U.S. workers, paying the prevailing wage, and complying with other labor standards. Businesses recruiting foreign workers also would be required to make significant financial investments in certified private sector initiatives dedicated to improving the competitiveness of U.S. workers. These payments should be set at a per worker amount sufficient to ensure there is no financial incentive to hire a foreign worker over a qualified U.S. worker.

- **Refugee admissions based on human rights and humanitarian considerations, as one of several elements of U.S. leadership in assisting and protecting the world's persecuted.**[5] Since its very beginnings, the United States has been a place of refuge. The Commission believes continued admission of refugees sustains our humanitarian commitment to provide safety to the persecuted, enables the U.S. to pursue foreign policy interests in promoting human rights, and encourages international efforts to resettle persons requiring rescue or durable solutions. The Commission also urges the federal government to continue to support international assistance and protection for the majority of the world's refugees for whom resettlement is neither appropriate nor practical.

The Commission continues to recommend against denying benefits to legal immigrants solely because they are noncitizens. The Commission believes that the denial of safety net programs to immigrants solely because they are noncitizens is not in the national interest. In our 1994 and 1995 reports, the Commission argued that Congress should address the most significant uses of public benefit programs —particularly, elderly immigrants using Supplementary Security Income— by requiring sponsors to assume full financial responsibility for newly-arriving immigrants who otherwise would be excluded on public charge grounds. In particular, the Commission argued that sponsors of parents

who would likely become public charges assume the responsibility for the lifetimes of the immigrants (or until they became eligible for Social Security on the basis of work quarters). We also argued that sponsors of spouses and children should assume responsibility for the duration of the familial relationship or a time-specified period. We continue to believe that this targeted approach makes greater sense than a blanket denial of eligibility for public services based solely on a person's alienage.

LIMITED DURATION ADMISSIONS

Persons come to the United States for limited duration stays for several principal purposes: representation of a foreign government or other foreign entities; work; study; and short-term visits for commercial or personal purposes, such as tourism and family visits. These individuals are statutorily referred to as "nonimmigrants." In this report, however, we refer to "limited duration admissions [LDAs]," a term that better captures the nature of their admission: When the original admission expires, the alien must either leave the country or meet the criteria for a new LDA or permanent residence.

For the most part LDAs help enhance our scientific, cultural, educational, and economic strength. However, the admission of LDAs is not without costs and, as explained below, certain reforms are needed to make the system even more advantageous for the United States than it now is.

The Commission believes LDA policy should rest on the following principles:

- Clear goals and priorities;
- Systematic and comprehensible organization of LDA categories;
- Timeliness, efficiency, and flexibility in its implementation;
- Compliance with the conditions for entry and exit (and effective mechanisms to monitor and enforce this compliance);
- Credible and realistic policies governing transition from LDA to permanent immigration status;
- Protection of U.S. workers from unfair competition and of foreign workers from exploitation and abuse; and
- Appropriate attention to LDA provisions in trade negotiations to ensure future immigration reforms are not unknowingly foreclosed.

The Commission recommends a reorganization of the visa categories for limited duration stays in the United States to make them more coherent and understandable. The Commission recommends that the current proliferation of visa categories be restructured into five broad groups: official representatives; foreign workers; students; short-term visitors; and transitional family members. This reorganization reflects such shared characteristics of different visa categories as entry for like reasons, similarity in testing for eligibility, and similar duration of stay in the United States.

The definitions and objectives of the five limited duration visa classifications would be:[6]

- **Official representatives** are diplomats, representatives of or to international organizations, representatives of NATO or NATO forces, and their accompanying family members. The objective of this category is to permit the United States to admit temporarily individuals who represent their governments or international organizations.
- **Short-term visitors** come to the United States for commercial or personal purposes. In 1995 alone, millions of inbound visitors from other countries spent $76 billion on travel to and in the United States (on U.S. flag carriers, lodging, food, gifts, and entertainment).

- **Foreign workers** are those who are coming to perform necessary services for prescribed periods of time, at the expiration of which they must either return to their home countries or, if an employer or family member petitions successfully, adjust to permanent residence. This category would serve the labor needs demonstrated by U.S. businesses, with appropriate provisions to protect U.S. workers from unfair competition.

- **Students** are persons who are in the United States for the purpose of acquiring either academic or practical knowledge of a subject matter. This category has four major goals: to provide foreign nationals with opportunities to obtain knowledge they can take back to their home countries; to give U.S. schools access to a global pool of talented students; to permit the sharing of U.S. values and institutions with individuals from other countries; and to enhance the education of U.S. students by exposing them to foreign students and their cultures.

- **Transitional family members** include fiancé(e)s of U.S. citizens. These individuals differ from other LDAs because they are processed for immigrant status, although they do not receive such status until they marry in the U.S. and adjust. The Commission believes another category of transitional family members should be added: spouses of U.S. citizens whose weddings occur overseas but who subsequently come to the U.S. to reside.

Short-Term Visitors

The Commission recommends that the current visa waiver pilot program for short-term business and tourist visits be made permanent upon the implementation of an entry-exit control system capable of measuring overstay rates. A permanent visa waiver system requires appropriate provisions to expand the number of participating countries and clear and timely means for removing those countries that fail to meet the high standards reserved for this privilege. Congress should extend the pilot three years while the control system is implemented.

Foreign Workers

Each year, more foreign workers enter the United States as LDAs for temporary work than enter as skill-based immigrants. In FY 1996, the Department of State issued almost 278,000 limited duration worker visas, including those for spouses and children. By contrast, only 118,000 immigrant visa issuances and domestic adjustments of status in worker categories were recorded in FY 1996, far less than the legislated limit of 140,000.

The Commission recommends that the limited duration admission classification for foreign workers include three principal categories: those who, for significant and specific policy reasons, should be exempt by law from labor market protection standards; those whose admission is governed by treaty obligations; and those whose admission must adhere to specified labor market protection ***standards***. Under this recommendation, LDA worker categories are organized around the same principles that guide permanent worker categories. Accordingly, the Commission proposes different subcategories with labor market protection standards commensurate with the risks to U.S. workers we believe are posed by the foreign workers.

- **Those exempt by law from labor market protection standards** because their admission will generate substantial economic growth and/or significantly enhance U.S. intellectual and cultural strength and pose little potential for undermining the employment prospects and remuneration of U.S. workers. These include:

  Individuals of extraordinary ability in the sciences, arts, education, business, or athletics, demonstrated through sustained national or international acclaim and recognized for extraordinary achievements in their field of expertise.

  Managers and executives of international businesses. The global competitiveness of U.S. businesses is enhanced by the capacity of multinational corporations to move their senior staff around the world as needed.

Professors, researchers and scholars whose salary or other compensation is paid by their home government, home institution, or the U.S. government in a special program for foreign professors, researchers, and scholars.

Religious workers, including ministers of religion and professionals and other workers employed by religious nonprofit organizations in the U.S. to perform religious vocations and religious occupations.

Members of the foreign media admitted under reciprocal agreements. The U.S. benefits from the presence of members of the foreign media who help people in their countries understand events in the United States. Just as we would not want our media to be overly regulated by labor policies of foreign governments, the United States extends the same courtesy to foreign journalists working in the U.S.

- ***Foreign workers whose admission is subject to treaty obligations.*** This includes treaty traders, treaty investors, and other workers entering under specific treaties between the U.S. and the foreign nation of which the alien is a citizen or national. Under the provisions of NAFTA, for example, Canadian professionals are not subject to numerical limits or labor market testing; Mexican professionals continue to be subject to labor market tests, but will be exempt from numerical limits in 2003.

- ***Foreign workers subject by law to labor market protection standards.*** These are principally:

  Professionals and other workers who are sought by employers because of their highly-specialized skills or knowledge and/or extensive experience. Included in this category are employees of international businesses who have specialized knowledge but are not managers or executives.

  Trainees admitted to the United States for practical, on-the-job training in a variety of occupations. Trainees work in U.S. institutions as an integral part of their training program.

  Artists, musicians, entertainers, athletes, fashion models, and participants in international cultural groups that share the history, culture, and traditions of their country.

  Lesser-skilled and unskilled workers coming for seasonal or other short-term employment. Such worker programs warrant strict review, as described below. The Commission remains opposed to implementation of a large-scale program for temporary admission of lesser-skilled and unskilled workers.

The Commission recommends that the labor market tests used in admitting temporary workers in this category be commensurate with the skill level and experience of the worker.

- **Employers requesting the admission of temporary workers with highly-specialized skills or extensive experience should meet specific requirements.** Admission should be contingent on an attestation that:

  The employer will pay the greater of actual or prevailing wage and fringe benefits paid to other employees with similar experience and qualifications for the specific employment in question. Actual wage rates should be defined in a simple and straightforward manner.

  The employer has posted notice of the hire, informed coworkers at the principal place of business at which the LDA worker is employed, and provided a copy of the attestation to the LDA worker.

  The employer has paid a reasonable user fee that will be dedicated to facilitating the processing of applications and the costs of auditing compliance with all requirements.

  There is no strike or lockout in the course of a labor dispute involving the occupational classification at the place of employment.

  The employer has not dismissed, except for cause, or otherwise displaced workers in the specific job for which the alien worker is hired during the previous six months. Further, the employer will not displace or lay off, except

for cause, U.S. workers in the specific job during the ninety-day period following the filing of an application or the ninety-day periods preceding or following the filing of any visa petition supported by the application.

The employer will provide working conditions for such temporary workers that are comparable to those provided to similarly situated U.S. workers.

- **Certain at-risk employers of skilled workers** (described below) should be required to attest to having taken significant steps—for example, recruitment or training—to employ U.S. workers in the jobs for which they are recruiting foreign workers. We do not recommend, however, that current labor certification processes be used to document significant efforts to recruit. These procedures are costly, time consuming, and ultimately ineffective in protecting highly-skilled U.S. workers.

- **Employers requesting the admission of lesser-skilled workers should be required to meet a stricter labor market protection test.** Such employers should continue to be required to demonstrate that they have sought, but were unable to find, sufficient American workers prepared to work under favorable wages, benefits, and working conditions. They also should be required to specify the plans they are taking to recruit and retain U.S. workers, as well as their plans to reduce dependence on foreign labor through hiring of U.S. workers or other means. Employers should continue to be required to pay the highest of prevailing, minimum, or adverse wage rates, provide return transportation, and offer decent housing, health care, and other benefits appropriate for seasonal employees.

The Commission recommends that categories of employers who are at special risk of violating labor market protection standards —regardless of the education, skill, or experience level of its employees— be required to obtain regular, independently-conducted audits of their compliance with the attestations made about labor market protection standards, with the results of such audit being submitted for Department of Labor review. Certain businesses, as described below, pose greater risk than others of displacing U.S. workers and/or exploiting foreign workers. The risk factors that should be considered in determining whether regular audit requirements must apply include:

- **The employer's extensive use of temporary foreign workers.** Extensive use can be defined by the percentage of the employer's workforce that is comprised of LDA workers. It also can be measured by the duration and frequency of the employer's use of temporary foreign workers.

- **The employer's history of employing temporary foreign workers.** Those employers with a history of serious violations of regular labor market protection standards or of specific labor standards related to the employment of LDA workers should be considered as at risk for future violations.

- **The employer's status as a job contracting or employment agency providing temporary foreign labor to other employers.** Risk of labor violations increases as responsibility is divided between a primary and secondary employer.

To ensure adequate protection of labor market standards, such employers should be required to submit an independent audit of their compliance with all statements attested to in their application. The independent audits should be done by recognized accounting firms that have the demonstrated capacity to determine, for example, that wages and fringe benefits were provided as promised in the attestation and conformed to the actual or prevailing wages and fringe benefits provided to similarly situated U.S. workers.

The Commission recommends enhanced monitoring of and enforcement against fraudulent applications and postadmission violations of labor market protection standards. To function effectively, both the exempt and nonexempt temporary worker programs must provide expeditious access to needed labor. The Commission's recommendations build on the current system of employer attestations that receive expeditious preapproval review but are subject to postapproval enforcement actions against violators. More specifically, the Commission recommends:

- **Allocating increased staff and resources to the agencies responsible for adjudicating applications for**

admission and monitoring and taking appropriate enforcement action against fraudulent applications and violations of labor market protection standards. Increased costs required for more efficient adjudication of applications can be covered by applicant fees. However, additional costs incurred for more effective investigations of compliance with labor market standards will require appropriated funds.

- **Barring the use of LDA workers by any employer who has been found to have committed willful and serious labor standards violations with respect to the employment of LDA workers. Further, upon the recommendation of any federal, state, or local tax agency, barring the use of LDA workers by any employer who has been found to have committed willful and serious payroll tax violations with respect to LDA workers.** The law currently provides for such debarment for failure to meet labor condition attestation provisions or misrepresentation of material facts on the application. Implementation of this recommendation would enable penalties to be assessed for serious labor standards violations that are not also violations of the attestations.

- **Developing an enforcement strategy to reduce evasion of the LDA labor market protection standards through contractors.** U.S. businesses' growth in contracting-out functions has raised questions of employment relationships and ultimate liability for employment-related violations, including those related to temporary foreign workers. A uniform policy for dealing with these situations is desirable for the enforcement agencies involved, as well as for employers, contractors, and workers.

CURBING UNLAWFUL MIGRATION

In its first interim report to Congress , the Commission recommended a comprehensive strategy to curb unlawful migration into the United States through prevention and removal.[7] Despite the additional resources, new policies, and often innovative strategies adopted during the past few years, illegal migration continues to be a problem. The Commission continues to believe that unlawful immigration can be curtailed consistent with our traditions, civil rights, and civil liberties. As a nation committed to the rule of law, our immigration policies must conform to the highest standards of integrity and efficiency in the enforcement of the law. We must also respect due process.

Deterrence Strategies

The Commission reiterates its 1994 recommendations supporting a comprehensive strategy to deter illegal migration. More specifically, the Commission continues to support implementation of the following deterrence strategies:

- **An effective border management policy that accomplishes the twin goals of preventing illegal entries and facilitating legal ones.** New resources for additional Border Patrol officers, inspectors, and operational support, combined with such new strategies as operations "Hold the Line," "Gatekeeper," and "Safeguard," have improved significantly the management of the border where they are deployed. The very success of these new efforts demonstrates that to gain full control, the same level of resources and prevention strategies must be deployed at all points on the border where significant violations of U.S. immigration law are likely to occur.

- **Reducing the employment magnet is the linchpin of a comprehensive strategy to deter unlawful migration.** Economic opportunity and the prospect of employment remain the most important draw for illegal migration to this country. Strategies to deter unlawful entries and visa overstays require both a reliable process for verifying authorization to work and an enforcement capacity to ensure that employers adhere to all immigration-related labor standards. The Commission supports implementation of pilot programs to test what we believe is the most promising option for verifying work authorization: a computerized registry based on the social security number.[8]

- **Restricting eligibility of illegal aliens for publicly-funded services or assistance, except those made available**

on an emergency basis or for similar compelling reasons to protect public health and safety or to conform to constitutional requirements. Although public benefit programs do not appear to be a major magnet for illegal migrants, it is important that U.S. benefit eligibility policies send the same message as immigration policy: Illegal aliens should not be here and, therefore, should not receive assistance, except in unusual circumstances. The Commission recommended drawing a line between illegal aliens and lawfully resident legal immigrants with regard to benefits eligibility, in part to reinforce this message. We continue to believe that this demarcation between legal and illegal aliens makes sense. The Commission urges the Congress to reconsider the changes in welfare policy enacted in 1996 that blur the distinctions between legal and illegal aliens by treating them similarly for the purposes of many public benefit programs.

- **Strategies for addressing the causes of unlawful migration in source countries.** An effective strategy to curb unauthorized movements includes cooperative efforts with source countries to address the push factors that cause people to seek new lives in the United States. The Commission continues to urge the United States government to give priority in its foreign policy and international economic policy to long-term reduction in the causes of unauthorized migration.

- **Mechanisms to respond in a timely, effective, and humane manner to migration emergencies.** A credible immigration policy requires the ability to respond effectively and humanely to migration emergencies in which large numbers of people seek entry into the United States. These emergencies generally include *bona fide* refugees, other individuals with need for protection, and persons seeking a better economic life in the U.S. Failure to act appropriately and in a timely manner to determine who should be admitted and who should be returned can have profound humanitarian consequences. Further, an uncontrolled emergency can overwhelm resources and create serious problems that far outlast the emergency.[9]

Removals

A credible immigration system requires the effective and timely removal of aliens who can be determined through constitutionally-sound procedures to have no right to remain in the United States. If unlawful aliens believe that they can remain indefinitely once they are within our national borders, there will be increased incentives to try to enter or remain illegally.

Our current removal system does not work. Hundreds of thousands of aliens with final removal orders remain in the U.S. The system's ineffectiveness results from a fragmented, uncoordinated approach, rather than flawed legal procedures. The Executive Branch does not have the capacity, resources, or strategy to detain aliens likely to abscond, to monitor the whereabouts of released aliens, or to remove them.

The Commission urges immediate reforms to improve management of the removal system and ensure that aliens with final orders of deportation, exclusion, or removal are indeed removed from the United States. Establishing a more effective removal system requires changes in the management of the removal process. More specifically, the Commission recommends:

- **Establishing priorities and numerical targets for the removal of criminal and noncriminal aliens.** The Commission encourages headquarters, regional, and local immigration enforcement officials to set these priorities and numerical goals.

- **Local oversight and accountability for the development and implementation of plans to coordinate apprehensions, detention, hearings, removal, and the prevention of reentry.** With guidance on priorities, local managers in charge of the removal system would be responsible for allocation of resources to ensure that aliens in the prioritized categories are placed in the system and ultimately removed. Local managers also would be responsible and accountable for identifying effective deterrents that reduce the likelihood that removed aliens would attempt to reenter the U.S.

- **Continued attention to improved means for identifying and removing criminal aliens with a final order of deportation.** The Commission reiterates the importance of removing criminal aliens as a top priority. Our recommendation regarding the importance of removing noncriminal aliens with final orders is not intended to shift the attention of the removal system away from this priority. Rather, both criminal and noncriminal aliens must be removed to protect public safety (in the case of criminals) and to send a deterrent message (to *all* who have no permission to be here).

- **Legal rights and representation.** The Executive Branch should be authorized to develop, provide, and fund programs and services that educate aliens about their legal rights and immigration proceedings. Such programs also should encourage and facilitate legal representation where to do so would be beneficial to the system and the administration of justice. Particular attention should be focused on aliens in detention where release or removal can be expedited through such representation. Under this approach, the alien would not have a right to appointed counsel, but the government could fund services to address some of the barriers to representation.

- **Prosecutorial discretion to determine whether to proceed with cases.** Guidelines on the use of prosecutorial discretion should be developed, local Trial Attorneys trained, support staff provided, and discretion exercised with the goal of establishing a more efficient and rational hearing system. Trial attorneys should focus their efforts on trying cases that are likely to result in the removal of the alien upon completion of the proceedings.

- **Strategic use of detention and release decisions.** Detention space, always in limited supply, is in greater demand as the government has focused more on the removal of criminal aliens and as Congress mandates more categories to be detained. Detention needs to be used more strategically if removals are to be accomplished. Alternatives to detention should be developed so that detention space is used efficiently and effectively. The Commission fully supports the three-year pilot program, created with and implemented by the Vera Institute, to help define effective alternatives to detention for specific populations.

- **Improved detention conditions and monitoring.** Detention cannot be used effectively unless the conditions of detention are humane and detainees are free from physical abuse and harassment by guards. We have no doubt that appropriate criteria for all facilities can be promulgated, based on sound governmental judgment and consultation with concerned nongovernmental organizations. But most importantly, a system to monitor facilities on a regular basis must be developed. Inspections must occur more than once annually.

  Further, the Commission recommends that the Department of Justice consider placing administrative responsibility for operating detention centers with the Bureau of Prisons or U.S. Marshals Service. An immigration enforcement agency should not be shouldered with such a significant responsibility that is not part of its fundamental mission or expertise.

- **Improved data systems.** Current data systems are unable to link an apprehension to its final disposition (e.g., removal, adjustment of status). This significantly limits the use of apprehension and removal data for analytical purposes. The Commission urges development of data systems that link apprehensions and removals and provide statistics on individuals.

- **The redesigned removal system should be managed initially by a Last-In-First-Out [LIFO] strategy to demonstrate the credibility of the system.** Once a coherent system is organized and appropriate resources are assigned to removing deportable aliens—not simply to put aliens through proceedings —removals should proceed in a Last-In-First-Out mode. In this way, the government can send a credible deterrent message to failed asylum seekers, visa overstayers, users of counterfeit documents, and unauthorized workers, that their presence in the United States will not be tolerated. Such a well-organized system can establish control over the current caseload and quickly prioritize the backlog for enforcement purposes. The deterrent effect of LIFO has been shown in the asylum system where new procedures were adopted in a LIFO mode.

The Commission urges Congress to clarify that the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 [IIRIRA] and the Antiterrorism and Effective Death Penalty Act of 1996 [AEDPA] do not apply retroactively to cases pending when the new policies and procedures went into effect. As a matter of policy, the Commission believes

that retroactive application of new immigration laws undermines the effectiveness and credibility of the immigration system. Applying newly-enacted laws or rules in an immigration proceeding that has already commenced results in inefficiency in the administration of the immigration laws. It also can raise troubling issues of fairness. Finally, it invites confusion, adds uncertainty, and fosters a lack of trust and confidence in the rule of law.

[5] For a full explanation of the Commission's refugee-related recommendations, see U.S. Refugee Policy: Taking Leadership, 1997.

[6] The current system includes the J visa for cultural exchange, which is used for a variety of purposes, ranging from short-term visits to study and work. The workers include scholars and researchers, camp counselors, au pairs, and various others. Some work activities under the J visa demonstrate a clear cultural or education exchange; other work activities appear only tangentially related to the program's original purposes. Protection of U.S. workers by labor market tests and standards should apply to the latter group in the same manner as similarly situated temporary workers in other LDA categories. The Department of State should assess how better to fulfill the purpose of the Mutual Educational and Cultural Exchange Act of 1961 [Fulbright-Hays Act]. Such an analysis is particularly timely in light of the merger now being implemented between the Department of State and the United States Information Agency, which is responsible for administering the J visa.

U.S. COMMISSION ON IMMIGRATION REFORM

1 9 9 7
REPORT TO CONGRESS
EXECUTIVE SUMMARY

Becoming an American: Immigration and Immigrant Policy

ACHIEVING IMMIGRATION POLICY GOALS

INTRODUCTION

Restoring credibility and setting priorities —themes at the center of the Commission's policy recommendations on illegal and legal immigration, respectively— will not come to pass unless the government is structured to deliver on these policies. An effective immigration system requires both credible policy and sound management. Good management cannot overcome bad policy. Poor structures, lack of professionalism, poor planning, and failure to set priorities will foil even the best policies.

Until relatively recently, the agencies responsible for implementing immigration policy were underfunded, understaffed, and neglected. During the past few years, however, massive increases in resources and personnel, combined with significant political attention to immigration issues, have provided new opportunities to address long-standing problems. A recent General Accounting Office [GAO] report documented improvements—including, for example, a more strategic approach to the formulation of immigration enforcement programs. The Commission has seen progress in many management areas—for example, more effective border management, increased numbers of criminal alien removals, and asylum reform that has deterred abusive claims while protecting *bona fide* refugees. Nevertheless, problems remain in the operation of the U.S. immigration and naturalization system. Further improvements must be made if it is to function smoothly and effectively, anticipating and addressing, rather than reacting to, problems.

STRUCTURAL REFORM

The Commission recommends fundamental restructuring of responsibilities within the federal government to support more effective management of the core functions of the immigration system: border and interior enforcement; enforcement of immigration-related employment standards; adjudication of immigration and naturalization applications; and consolidation of administrative appeals. The immigration system is one of the most complicated in the federal government bureaucracy. In some cases, one agency has multiple, and sometimes conflicting, operational responsibilities. In other cases, multiple agencies have responsibility for elements of the same functions. Both situations create problems.

Mission Overload. Some of the agencies that implement the immigration laws have so many responsibilities that they have proved unable to manage all of them effectively. Between Congressional mandates and administrative determinations, these agencies must give equal weight to more priorities than any one agency can handle. Such a system is set up for failure and, with such failure, further loss of public confidence in the immigration system.

No one agency is likely to have the capacity to accomplish all of the goals of immigration policy equally well.

Immigration law enforcement requires staffing, training, resources, and a work culture that differs from what is required for effective adjudication of benefits or labor standards regulation of U.S. businesses.

Diffusion of Responsibilities Among Agencies. Responsibility for many immigration functions are spread across numerous agencies within single departments or between departments. For example, responsibility for making decisions on skill-based immigrant and LDA applications is dispersed among the Department of Labor [DOL], the Department of Justice's [DOJ] Immigration and Naturalization Service [INS], and the Department of State [DOS]. Responsibility for investigating employer compliance with immigration-related labor standards is shared by INS and DOL.

The Commission considered a range of ways to reorganize roles and responsibilities, including proposals to establish a Cabinet-level Department of Immigration Affairs. After examining the full range of options, the Commission concludes that a clear division of responsibility among existing federal agencies, with appropriate consolidation of functions, will improve management of the federal immigration system. As discussed below, ***the Commission recommends a restructuring of the immigration system's four principal operations as follows:***[10]

> ***1. Immigration enforcement at the border and in the interior of the United States in a Bureau for Immigration Enforcement at the Department of Justice;***
>
> ***2. Adjudication of eligibility for immigration-related applications (immigrant, limited duration admission asylum, refugee, and naturalization) in the Department of State under the jurisdiction of an Undersecretary for Citizenship, Immigration, and Refugee Admissions;***
>
> ***3. Enforcement of immigration-related employment standards in the Department of Labor; and***
>
> ***4. Appeals of administrative decisions including hearings on removal, in an independent body, the Agency for Immigration Review.***

The Commission believes this streamlining and reconfiguring of responsibilities will help ensure: coherence and consistency in immigration-related law enforcement; a supportive environment for adjudication of applications for immigration, refugee, and citizenship services; rigorous enforcement of immigration-related labor standards to protect U.S. workers; and fair and impartial review of immigration decisions.

Bureau for Immigration Enforcement (DOJ)

The Commission recommends placing all responsibility for enforcing United States immigration laws to deter future illegal entry and remove illegal aliens in a Bureau for Immigration Enforcement at the Department of Justice. The Commission believes that the importance and complexity of the enforcement function within the U.S. immigration system necessitate the establishment of a higher-level, single-focus agency within the DOJ. The Commission further recommends that the newly configured agency have the prominence and visibility that the Federal Bureau of Investigation [FBI] currently enjoys within the DOJ structure. The Director of the Bureau would be appointed for a set term (e.g., five years). The agency would be responsible for planning, implementing, managing, and evaluating all U.S. immigration enforcement activities both within the United States and overseas.

The Commission recommends the following distribution of responsibilities within the Bureau for Immigration Enforcement.

Uniformed Enforcement Officers. The Commission recommends merger of the INS Inspectors, Border Patrol, and detention officers into one unit, the Immigration Uniformed Service Branch. Its officers would be trained for duties at land, sea, and air ports of entry, between land ports on the border, and in the interior where uniformed officers are needed for enforcement.

Investigators. The Commission believes investigations will be a key part of the new agency's responsibility.

Investigators are the main agents responsible for identifying and apprehending people who are illegally residing or working in the United States, for deterring smuggling operations, for building a case against those who are not deterred, and for identifying, apprehending, and carrying out the removal of aliens with final enforceable orders of removal.

Intelligence. The Bureau will require an Intelligence Division to provide strategic assessments, training and expertise on fraud, information about smuggling networks, and tactical support to uniformed officers or investigators.

Assets Forfeiture Unit. As with the other DOJ enforcement agencies, the Bureau will have an Assets Forfeiture unit.

Pre- and Post-Trial "Probation" Officers. "Probation" functions are not now performed consistently or effectively, but the Commission believes this function is essential to more strategic use of detention space. As it is unlikely that all potentially deportable aliens could or should be detained awaiting removal, the Commission believes more attention should be given to supervised release programs and to sophisticated methods for tracking the whereabouts of those not detained.

Trial Attorneys/Prosecutors. The Commission believes that the Trial Attorneys, who in effect are the Government's immigration prosecutors, should be vested with, *and should utilize*, an important tool possessed by their criminal counterparts: prosecutorial discretion.

Field Offices. The new agency would implement its programs through a series of field offices that are structured to address comprehensively the immigration enforcement challenges of the particular locality. As the location of these offices should be driven by enforcement priorities, they are likely to be in different places than current district offices. Regional Offices could be retained for administrative and managerial oversight of these dispersed and diverse field offices.

Citizenship, Immigration, and Refugee Admissions (DOS)

The Commission recommends that all citizenship and immigration benefits adjudications be consolidated in the Department of State, and that an Undersecretary for Citizenship, Immigration, and Refugee Admissions be created to manage these activities. At present, three separate agencies—the INS, the Department of State, and the Department of Labor—play broad roles in adjudicating applications for legal immigration, limited duration admissions, refugee admissions, asylum, and/or citizenship. The Commission believes a more streamlined and accountable adjudication process, involving fewer agencies but greater safeguards, will result in faster and better determinations of these benefits. As in the current system, these services would be funded through fees paid by applicants and retained by the benefits offices for delivery of the services.

The Commission considered the advantages and disadvantages of consolidating responsibility in the Department of Justice and in the Department of State, the two agencies that already have the most significant immigration, refugee, and citizenship duties. Bearing in mind the dual problems the Commission identified in the current structures—mission overload and fragmentation of responsibility, we concluded that consolidation in the Department of State makes greater sense than creation of a new, separate benefits agency within the Department of Justice.

Taking responsibility for immigration and citizenship services out of the Department of Justice sends the right message, that legal immigration and naturalization are not principally law enforcement problems; they are opportunities for the nation as long as the services are properly regulated. Further, the Department of Justice does not have the capacity internationally to take on the many duties of the Department of State. The Department of State, however, already has a domestic presence and an adjudication capability. It issues one-half million immigrant visas and six million nonimmigrant visas each year. DOS also provides a full range of citizenship services both domestically (issuance of almost 6 million passports annually) and abroad (e.g., citizenship determinations and registration of births of U.S. citizens overseas). Indeed, DOS has devoted a major share of its personnel and its capital and operating resources to these adjudicatory functions at embassies and consulates in more than two hundred countries and in passport offices in fifteen U.S. cities.

Consolidating responsibility requires some changes in the way the Department of State administers its immigration responsibilities, which we believe will strengthen the adjudication function. Because immigration has both foreign and domestic policy import, the Department of State will need to develop mechanisms for consultation with groups representing a broad range of views and interests regarding immigration. Such consultations already occur in the refugee program. The Department of State also will need to change its historic position on review of consular decisions. At present, decisions made at INS and the Department of Labor on many immigrant and LDA applications may be appealed, but no appeal is available on consular decisions. The Commission believes that immigrant and certain limited duration admission visas with a U.S. petitioner should be subject to independent administrative appeal (see below).

The Undersecretary, who would have direct access to the Secretary of State, would be responsible for domestic and overseas immigration, citizenship, and refugee functions. These include adjudication of applications for naturalization, determinations of citizenship overseas, all immigrant and limited duration admission petitions, work authorizations and other related permits, and adjustments of status. It also would have responsibility for refugee status determinations abroad and asylum claims at home. Overseas citizenship services would continue to be provided by consular officers abroad. The agency would have enhanced capacity to detect, deter, and combat fraud and abuse among those applying for benefits.

Within the Office of the Undersecretary would be a unit responsible both for formulating and assessing immigration policy as well as reviewing and commenting on the immigration-related effects of foreign policy decisions. This policy capacity would be new for the Department of State, but it is in keeping with the important role that migration now plays in international relations.

The Undersecretary would have three principal operating bureaus:

A Bureau of Immigration Affairs would focus on the immigration process, as noted above, as well as on LDA processing. In addition to its existing overseas work, the Immigration Affairs Bureau would be responsible for domestic adjudication/examination functions, including work authorization, adjustment of status, domestic interviewing, and the issuance of appropriate documentation (e.g., green cards). The Immigration Affairs Bureau also would staff immigration information and adjudication offices in areas with immigrant concentrations.

A Bureau of Refugee Admissions and Asylum Affairs would assure an appropriate level of independence from routine immigration issues and processes. It would combine the present Bureau for Population, Refugees and Migration [PRM] responsibilities for overseas refugee admissions, the refugee and asylum offices of the INS, and the DOS asylum office in the Bureau of Democracy, Human Rights and Labor. This would integrate the key governmental offices in one of our most important and historic international activities.

A Bureau of Citizenship and Passport Affairs would be responsible for naturalization, other determinations of citizenship, and issuance of passports. Local offices performing some citizenship functions, such as overseas travel information, passport and naturalization applications, testing and interviews, could be located with local immigration services.

Overseas citizen services would continue to be handled within the newly consolidated organization. These services include: responding to inquiries as to the welfare or whereabouts of U.S. citizens; assisting when U.S. citizens die, are arrested, or experience other emergencies abroad; providing notarial services; and making citizenship determinations and issuing passports abroad.

Quality Assurance Offices would oversee records management, monitoring procedures, fraud investigations, and internal review. At present, monitoring of the quality of decisions made on applications for immigration and citizenship benefits receives insufficient attention. The Commission believes that quality decisions require some form of internal supervisory review for applicants who believe their cases have been wrongly decided. This type of review helps an agency monitor consistency and identify problems in adjudication and offers a means of correcting errors. A staff responsible for and dedicated to ensuring the quality of decisions taken on applications for immigration and citizenship should address some of the weaknesses in the current system, such as those recently identified in the naturalization process.

With respect to the domestic field structure for implementing these programs, the Regional Service Centers [RSCs] and National Visa Center [NVC] would continue to be the locus of most adjudication. The physical plants are excellent and the locally-hired staffs are trained and in place. At this time, information is passed from the RSCs to the NVC when the applicant for admission is overseas. Overseas interviews would continue to take place at embassies and consulates.

A range of other interviews would take place domestically. Ideally, to avoid long lines and waits for service, there would be smaller offices in more locations that the current INS district offices. The Commission recommends against locating these offices with the enforcement offices discussed above. Asking individuals requesting benefits or information to go to an enforcement agency sends the wrong message about the U.S. view of legal immigration.

Immigration-Related Employment Standards (DOL)

The Commission recommends that all responsibility for enforcement of immigration-related standards for employers be consolidated in the Department of Labor. These activities include enforcing compliance with requirements to verify work authorization and attestations made regarding conditions for the legal hire of temporary and permanent foreign workers. The Commission believes that as this is an issue of labor standards, the Department of Labor is the best equipped federal agency to regulate and investigate *employer compliance* with standards intended to protect U.S. workers. The hiring of unauthorized workers and the failure of employers to comply with the commitments they make (e.g., to pay prevailing wages, to have recruited U.S. workers) in obtaining legal permission to hire temporary and permanent foreign workers are violations of such labor standards. Enforcement of compliance with these requirements currently lies within the responsibility of both INS and DOL. Under consolidation, the DOL Employment Standards Administration's [ESA] Wage and Hour Division [WH] and Office of Federal Contract Compliance Programs [OFCCP] would perform these functions in conjunction with their other worksite labor standards activities.

Sanctions Against Employers Who Fail to Verify Work Authorization. The Commission believes all worksite investigations to ascertain employers' compliance with employment eligibility verification requirements should be conducted by DOL. DOL already conducts many of these investigations. However, under this recommendation, DOL also would assess penalties if employers fail to verify the employment eligibility of persons being hired. DOL would not be required to prove that an employer knowingly hired an illegal worker, just that the employer hired a worker without verification of his or her authorization to work. With implementation of the Commission's proposal for a more effective verification process, this function will be critical to deterring the employment of unauthorized workers.[11]

Enforcement of Skill-Based Immigrant and Limited Duration Admissions Requirements. The Commission believes an expedited process is needed for the admission of both temporary and permanent foreign workers, as discussed earlier in this report, as long as adequate safeguards are in place to protect the wages and working conditions of U.S. workers. To prevent abuse of an expedited system, an effective postadmission enforcement scheme is necessary.

DOL's other worksite enforcement responsibilities place it in the best position to monitor employers' compliance with the attestations submitted in the admissions process. DOL investigators are experienced in examining employment records and interviewing employees. Penalties should be established for violations of the conditions to which the employer has attested, including payment of the appropriate wages and benefits, terms and conditions of employment, or any misrepresentation or material omissions in the attestation. Such penalties should include both the assessment of significant administrative fines as well as barring egregious or repeat violators from petitioning for the admission of permanent or temporary workers.

Agency for Immigration Review

The Commission recommends that administrative review of all immigration-related decisions be consolidated and be considered by a newly-created independent agency, the Agency for Immigration Review, within the Executive

Branch. The Commission believes that a system of formal administrative review of immigration-related decisions—following internal supervisory review within the initial adjudicating body—is indispensable to the integrity and operation of the immigration system. Such review guards against incorrect and arbitrary decisions and promotes fairness, accountability, legal integrity, uniform legal interpretations, and consistency in the application of the law both in individual cases and across the system as a whole.

The review function works best when it is well insulated from the initial adjudicatory function and when it is conducted by decisionmakers entrusted with the highest degree of independence. Not only is independence in decisionmaking the hallmark of meaningful and effective review, it is also critical to the reality and the perception of fair and impartial review.

Hence, the Commission recommends that the review function be conducted by a newly-created independent reviewing agency in the Executive Branch. To ensure that the new reviewing agency is independent and will exist permanently across Administrations, we believe it should be statutorily created. It would incorporate the activities now performed by several existing review bodies, including the DOJ Executive Office for Immigration Review, the INS Administrative Appeals Office, the DOL Board of Alien Labor Certification Appeals, and the DOS Board of Appellate Review. It also would have some new responsibilities.

This reviewing agency would be headed by a Director, a presidential appointee, who would coordinate the overall work of the agency, but would have no say in the substantive decisions reached on cases considered by any division or component within the agency.

There would be a trial division headed by a Chief Immigration Judge, appointed by the Director. The Chief Judge would oversee a corps of Immigration Judges sitting in immigration courts located around the country. The Immigration Judges would hear every type of case presently falling within the jurisdiction of the now-sitting Immigration Judges.

The reviewing agency also would consider appeals of decisions by the benefits adjudication agency, using staff with legal training. Although the benefits adjudication agency will handle a wide range of applications—from tourist visas to naturalization and the issuance of passports—not all determinations will be appealable, as is the case under current law. We envision that those matters that are appealable under current law would remain appealable. The only difference is that the appeal would be lodged with and considered by the new independent Agency for Immigration Review rather than by the various reviewing offices and Boards presently located among the several Departments. The administrative appeals agency also would consider appeals from certain visa denials and visa revocations by consular officers. Under current law, such decisions are not subject to formal administrative or judicial review. The Commission believes that consular decisions denying or revoking visas in specified visa categories—i.e., all immigrant visas and those LDA categories where there is a petitioner in the United States who is seeking the admission of the visa applicant—should be subject to formal administrative review. The visa applicant would have no right to appeal an adverse determination. Instead, standing to appeal a visa denial or revocation would lie only with United States petitioners, whether U.S. citizens, lawful permanent residents, or employers.

An appellate Board would sit over the trial and administrative appeals divisions of the new independent Agency for Immigration Review. This appellate Board would be the highest administrative tribunal in the land on questions and interpretations of immigration law. It would designate selected decisions as precedents for publication and distribution to the public at large. Its decisions would be binding on all officers of the Executive Branch. To ensure the greatest degree of independence, decisions by the Board would be subject to reversal or modification only as a result of judicial review by the federal courts or through congressional action. Neither the Director of the reviewing agency nor any other agency or Department head could alter, modify, or reverse a decision by the appellate Board.

MANAGEMENT REFORM

The Commission urges the federal government to make needed reforms to improve management of the immigration system. While the Commission-recommended structural changes will help improve implementation of U.S. policy,

certain management reforms also must be adopted if the restructured agencies responsible for immigration matters are to be effective in performing their functions. Structural reforms will not by themselves solve some of the management problems that have persisted in the immigration agencies.

More specifically, the Commission recommends:

- **Setting More Manageable and Fully-Funded Priorities.** The Commission urges Congress and the Executive Branch to establish and then appropriately fund a more manageable set of immigration-related priorities. More manageable means fewer objectives, but also a set of more integrated priorities, more realistically-achievable short-term and long-term goals, and greater numerical specificity on expected annual outcomes to which agencies could be held accountable.

- **Developing More Fully the Capacity for Policy Development, Planning, Monitoring, and Evaluation.** Each department with immigration-related responsibilities needs to perform a wide range of policy functions, including, but not limited to, long-range and strategic policy planning, interagency policy integration, policy review, policy coordination, priority setting, data collection and analysis, budget formulation, decisionmaking, and accountability. The Domestic Policy Council and the National Security Council in the White House can also play an important role in coordinating policy development across departments.

- **Improving Systems of Accountability.** Staff who are responsible for immigration programs should be held accountable for the results of their activities. Systems should be developed to reward or sanction managers and staff on the basis of their performance.

- **Recruiting and Training Managers.** The Commission believes enhancements must be made in the recruitment and training of managers. As immigration-related agencies grow and mandated responsibilities increase or evolve, closer attention should be paid to improving the skills and managerial capacity of immigration staff at all levels to ensure more efficient and effective use of allocated resources.

- **Strengthening Customer Service Orientation.** The Commission urges increased attention to instilling a customer-service ethic in staff, particularly those responsible for adjudication of applications for benefits.

- **Using Fees for Immigration Services More Effectively.** The Commission supports the imposition of user fees, but emphasizes: (1) that the fees should reflect true costs; (2) that the agencies collecting the fees should retain them and use them to cover the costs of those services for which the fees are levied; (3) that those paying fees should expect to be treated to timely and courteous service; and (4) that maximum flexibility should be given to agencies to expand or contract their response expeditiously as applications increase or decrease.

The Commission reiterates its 1994 recommendations concerning the need for improvements in immigration data collection, coordination, analysis, and dissemination. Although some progress has been made, much more needs to be done to collect data that will inform responsible immigration policymaking. The Commission believes that each agency involved in immigration must establish a system and develop a strategy for the collection, interagency coordination, analysis, dissemination, and use of reliable data.

Further, the Commission urges the federal government to support continuing research and analysis on the implementation and impact of immigration policy. In particular, the federal government should support data collection and analysis in the following areas: longitudinal surveys on the experiences and impact of immigrants; on the experiences and impact of foreign students and foreign workers admitted for limited duration stays; and on the patterns and impacts of unlawful migration.

[10]See Appendix for Commissioner Leiden's concurring statement.

[11]At present, DOL investigates employer compliance with the requirement to check documentation and fill out the I-9 form, while INS does this paperwork review and investigations of knowing hire of illegal aliens. The latter investigations are hampered, however, by the absence of an effective verification process and proliferation of fraudulent documents.

U.S. COMMISSION ON IMMIGRATION REFORM

1 9 9 7
REPORT TO CONGRESS
EXECUTIVE SUMMARY

Becoming an American: Immigration and Immigrant Policy

CONCLUSION

This report concludes the work of the U.S. Commission on Immigration Reform. Together with our three interim reports, this final set of recommendations provides a framework for immigration and immigrant policy to serve our national interests today and in the years to come. The report outlines reforms that will enhance the benefits of legal immigration while mitigating potential harms, curb unlawful migration to this country, and structure and manage our immigration system to achieve all these goals. Most importantly, this report renews our call for a strong commitment to Americanization, the process by which immigrants become part of our community and we learn and adapt to their presence. Becoming an American is the theme of this report. Living up to American values and ideals is the challenge for us all.

Return to Table of Contents

INTRODUCTION

Immigration and immigrant policy is about immigrants, their families and the rest of us. It is about the meaning of American nationality and the foundation of national unity. It is about uniting persons from all over the world in a common civic culture.

The process of becoming an American is most simply called "Americanization," which must always be a two-way street. All Americans, not just immigrants, should understand the importance of our shared civic culture to our national community. This final report of the U.S. Commission on Immigration Reform makes recommendations to further the goals of Americanization by setting out *immigrant* policies to help orient immigrants and their new communities, to improve educational programs that help immigrants and their children learn English and civics, and to reinforce the integrity of the naturalization process through which immigrants become U.S. citizens.

This report also makes recommendations regarding *immigration* policy. It reiterates and updates the conclusions we reached in three interim reports—on unlawful migration, legal immigration, and refugee and asylum policy—and makes additional recommendations for reforming immigration policies. Further, in this report, the Commission recommends ways to improve the structure and management of the federal agencies responsible for achieving the goals of immigration policy. It is our hope that this final report *Becoming An American: Immigration and Immigrant Policy,* along with our three interim reports, constitutes a full response to the work assigned the Commission by Congress: to assess the national interest in immigration and report how it can best be achieved.

MANDATE AND METHODS

Public Law 101-649, the Immigration Act of 1990 [IMMACT], established this Commission to review and evaluate the impact of immigration policy. More specifically, the Commission must report on immigration's impact on: the need for labor and skills; employment and other aspects of the economy; social, demographic, and environmental conditions; and the foreign policy and national security interests of the United States. The Commission engaged in a wide variety of fact-finding activities to fulfill this mandate. Site visits were conducted throughout the United States. Commission members visited immigrant and refugee communities in California, Texas, Florida, New York, Massachusetts, Illinois, Arizona, Washington, Kansas, Virginia, Washington, DC, Puerto Rico and the Commonwealth of the Northern Mariana Islands. Some Commission and staff members also visited such major source countries as Mexico, the Dominican Republic, Cuba, Haiti, and the Philippines. To increase our understanding of international refugee policy issues, members and staff of the Commission visited Bosnia, Croatia, Germany, and Kenya, and consulted with Geneva-based officials from the U.N. High Commission for Refugees and the International Organization for Migration. We held more than forty public hearings, consultations with government and private sector officials, and expert roundtable discussions.

TODAY'S IMMIGRANTS

The effects of immigration are numerous, complex, and varied. Immigrants contribute in many ways to the United States: to its vibrant and diverse communities; to its lively and participatory democracy; to its vital intellectual and cultural life; to its renowned job-creating entrepreneurship and marketplaces; and to its family values and hard-work ethic. However, there are costs as well as benefits from today's immigration. Those workers most at risk in

our restructuring economy—low-skilled workers in production and service jobs—are those who directly compete with today's low-skilled immigrants. Further, immigration presents special challenges to certain states and local communities that disproportionately bear the fiscal and other costs of incorporating newcomers.

Characteristics of Immigrants

In FY 1996 (the last year for which data are available), more than 900,000 immigrants came to the United States from 206 nations, for a variety of reasons and with a diverse set of personal characteristics. Not surprisingly, the characteristics of immigrants from different sending countries vary, as do their effects on the U.S. There are also differences between immigrants admitted under different classes of admission. These differences generally reflect the statutory provisions that guide admissions. [See Appendix for description of IMMACT's more specific provisions and its effects.]

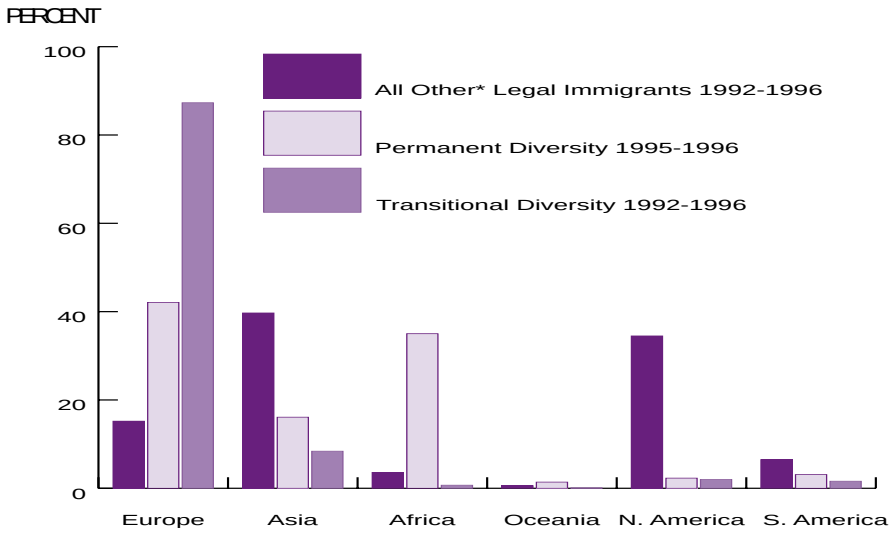
Places of Origin. Asia and North America (i.e., Mexico, Canada, the Caribbean, and Central America) remain the sending regions with the largest share of immigrants. Mexico remains the largest sending country and its share of total legal immigrants to the U.S. increased from an average of 12 percent in the 1980s to more than 13 percent in FY 1994 and up to 18 percent in FY 1996. The effects of the Immigration Reform and Control Act of 1986 [IRCA], which resulted in the legalization of about two million formerly illegal Mexican residents, explains this trend. Even though the special admission category for the spouses of legalized aliens' dependents has been discontinued, Mexico benefits from the IMMACT's removal of per- country limits on the numerically limited spouse and children class of admission (FB-2A).

IMMACT established a transitional and a permanent "diversity" category for countries whose admission numbers were adversely

affected by the Immigration Act of 1965. The transitional program was in effect from FY 1992 to 1994, but unused visas were carried over through FY 1996. The permanent program went into effect in FY 1995. European countries benefitted the most from the transitional program, which mandated that as many as 40 percent of the visas could go to nationals of Ireland. Actual Irish admissions reached only 35 percent, with Polish immigrants accounting for an even larger share (38 percent). Under the permanent diversity program, 42 percent of the immigrants came from European countries and 35 percent came from Africa. The effect on African admissions is particularly noteworthy as Africans account for less than 1 percent of immigrants in other admission categories.

Origins of Diversity Immigrants versus All Other* Immigrants



*Other includes immigrants in family, employment, and humanitarian-based categories of admission.

Intended U.S. Destinations. Immigrants in FY 1996 continue to select just a few states as their destinations. About two-thirds intend to reside in California, New York, Texas, Florida, and New Jersey. One-quarter of admissions are to California alone with another one-seventh to New York. New York City retains its place as the pre-eminent immigrant city with 15 percent of immigrants intending to go there. About 7 percent of immigrants intend to go to Los Angeles, and Miami and Chicago are in third place with about 4.5 percent each of the total. There has been little change in these leading destinations since IMMACT. However, some new destinations have emerged in recent years. For example, during the past decade, such midwestern and southern states as Mississippi, Nebraska, Kansas, Georgia and North Carolina saw more than a doubling of the number of immigrants intending to reside there. Although the numbers are significantly smaller than the more traditional destinations, absorbing more new immigrants can be a challenge for these newer destinations that often do not have the immigration-related infrastructure of the traditional receiving communities.

Age. Immigrants in FY 1996 remain young, with the largest proportion being in their later teens or twenties. A little more than one-fifth are children 15 years of age or younger, and another one-fifth are 45 years or older. More than one-half of family-based immigrants are younger than 30 years of age, reflecting the predominance of spouses and children. Because of beneficiaries, employment-based immigrants have just as many minor dependents age 15 years and younger as other groups, but more than two-fifths of these employment-based immigrants themselves are 30-44 years, the experienced and highly productive working ages. Diversity immigrants have a similar, yet somewhat younger, age distribution than other classes of admission. In contrast, and in large part due to those admitted as refugees from the former Soviet Union, humanitarian admissions tend to be somewhat older than other immigrants.

Age Groups of 1996 Legal Immigrants (Principals and Derivative Beneficiaries)

GROUP	ALL	FAMILY	EMPLOYMENT	DIVERSITY	HUMANITARIAN
15 yrs. & younger	22%	23%	20%	22%	20%
16 through 29 yrs.	31%	34%	23%	33%	27%
30 through 44 yrs.	27%	23%	44%	34%	24%
45 through 60 yrs.	15%	14%	12%	10%	21%
65 years & older	5%	5%	0%	1%	8%

Source: INS FY 1996 Public Use Admissions Data.

Gender. Females were 54 percent of admissions in FY 1996. There had been an essentially even balance of men and women during the decade of the 1980s. The increased share of females in the 1990s parallels the historical tendency toward more female immigrants throughout much of the post-World War II period. It also reflects the admission of the spouses of legalized aliens who were predominantly male. In FY 1996, family-based admissions were predominantly female (57 percent) and employment-based admissions (including beneficiaries) were evenly balanced by gender. Diversity (45 percent female) and humanitarian (48 percent female) admissions, in contrast, had more male immigrants. That a slight majority of FY 1996 humanitarian admissions were male is somewhat surprising given that worldwide refugee populations are disproportionately female.

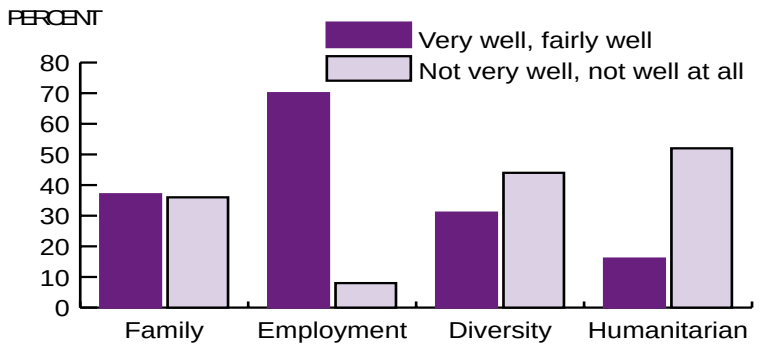
English ability. The Immigration and Naturalization Service [INS] admissions data do not include information on English language ability (or education, as discussed below). The following analysis draws instead on preliminary data from the New Immigrant Survey [NIS],[1] which studied a sample of immigrants admitted in FY 1996. The NIS is a pilot study designed to test the feasibility of a longi-

[1] Jasso, G.; Massey, D.S.; Rosenzweig, M.R.; Smith, J.P. 1997. The New Immigrant Survey [NIS] Pilot Study: Preliminary Results. Paper presented at the Joint Meeting of the Public Health Conference on Records and Statistics and the Data Users Conference, Washington, DC. (July.)

tudinal immigrant survey. Although the data are not yet published, analysis indicates that it offers promise of providing certain information about immigrants that has not previously been available.

The NIS, using the same measure as the U.S. Census, reports on the English language proficiency of adult legal immigrants who are 18 years and older. The initial results show that employment-based immigrants report the greatest English ability—70 percent of employment-based admissions report speaking at least fairly well and less than 10 percent speak very little or no English (the remainder report an "average" speaking ability). About 37 percent of family-based admissions report speaking English at least fairly well and an almost equal proportion report speaking little or no English. The diversity immigrants tend to report even less English ability, despite the requirement that they have at least a high school education. The humanitarian admissions trail the furthest behind in reported English language ability. Only 16 percent report speaking English at least fairly well, while more than 50 percent report speaking little or no English.

English Language Proficiency among New Adult Immigrants (18 years and older): 1996

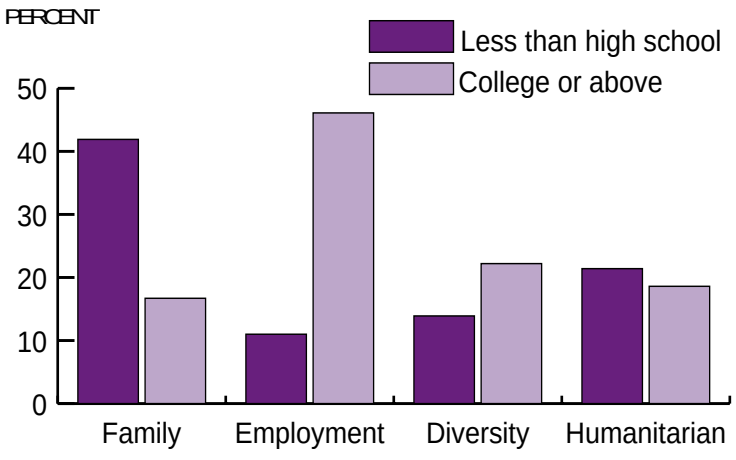


Source: Jasso, G.; et al. 1997. New Immigrant Survey Pilot Study.

Education. The years of schooling completed by immigrants is perhaps one of the most critical measures of skill level. The NIS provides our first indicators of years of education of adult legal immigrants at the time of their admission. As found in studies of foreign-born residents, the immigrants surveyed by the NIS tend to cluster at the higher or lower ends of the educational spectrum and differ significantly in their educational attainment by class of admission. Fully 46 percent of employment-based admissions have completed four years of college or a graduate degree. This figure includes principals and beneficiaries, making it likely that well-educated employment-based immigrants tend to have well-educated spouses. In contrast, just 17 percent of family-based immigrants 25 years and older have completed a college-level education while 42 percent have less than a high school education.

Diversity immigrants are required to have a high school education or two years of skilled work experience. The NIS data show that diversity immigrants tend to be better educated than family-based,

Educational Attainment of Legal Immigrants (25 years and older): 1996



Source: Jasso, G.; et al. 1997. New Immigrant Survey Pilot Study.

but not as well educated as employment-based immigrants. About 14 percent have not completed high school. They may be either principals who meet the work but not the education requirement or the spouses of the principals. Twenty-two percent of diversity immigrants have completed college or done graduate-level education, about the same proportion as among U.S. natives.[2]

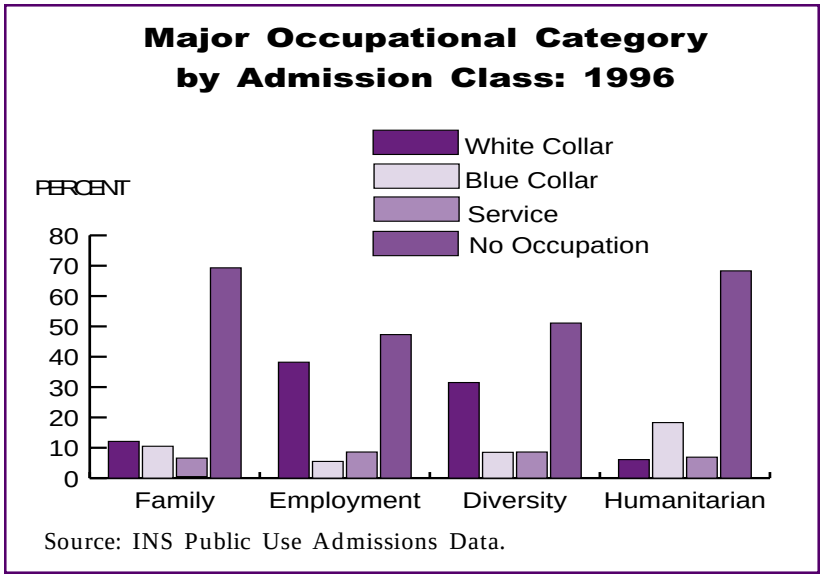
The humanitarian classes of admission are less well educated than the employment-based, but are better educated than family admissions. The large number of relatively well-educated persons admitted as refugees from the Soviet Union may partly explain this finding. About 21 percent have less than a high school education, while about 19 percent have college or higher degrees.

Occupation. Ultimately, the English and educational skills that immigrants have are reflected in their occupations. The INS admissions data, which we use here, have only crude occupational classifications. It imperfectly captures the difference between immigrants who adjust into legal permanent resident [LPR] status after working in a U.S. job for several years and those who report an occupation upon admission that tells us more about what the immigrant did at home than what they will do here.

Sixty-five percent of all immigrants in FY 1996 reported no occupation or being a "homemaker," reflecting the fact that children, parents, and spouses are a large share of all admissions and most do not work at the time of entry.

---

[2] The U.S. Current Population Survey [CPS] permits us to compare directly to the native-born, but the foreign-born data do not distinguish by admission status. The CPS data also include illegal aliens who have extremely low levels of education in the foreign-born category. See: Fix, M.; Passel, J.S. 1994. *Immigration and Immigrants: Setting the Record Straight*. Washington, DC: The Urban Institute. These figures for the diversity class of admission correspond to data on education collected by the U.S. Department of State for diversity immigrants only.



Source: INS Public Use Admissions Data.

Nevertheless, occupational status faithfully reflects the legal requirements of the admission class—the proportion of all immigrants not reporting an occupation is greater among family and humanitarian admissions, about 70 percent of all immigrants in each category. By way of comparison, only about one-half of all employment and diversity admissions have no reported occupation.[3] The skills which immigrants bring to the United States are reflected in their type of occupations. Family and humanitarian immigrants are primarily blue-collar workers. In contrast, employment-based and permanent diversity immigrants are predominantly white-collar workers. These broad differences between the major classes of admission have changed only slightly over the past three decades.

IMMACT has had an effect on occupational distribution within these broad categories. To gauge its effects, a research paper prepared for

[3] The initial results from the NIS pilot show that about 40 percent of adult nonexempt family immigrants are not employed. Alternatively, more than 95 percent of employment-based principals are employed. The INS admission figures for "no occupation" include children and persons who are unemployed, retired, or for whom no information is given.

FY 1996 Regular Admissions by Occupation: Predicted and Actual

OCCUPATION	PREDICTED (WITHOUT IMMACT)	ACTUAL (WITH IMMACT)	EXCESS OF ACTUAL OVER PREDICTED
WHITE-COLLAR WORKERS			
Professional, Technical, and Kindred			
Health Professionals	10,244	18.986	85%
Other Professionals	9,231	19,477	111%
Technical & Specialty	22,115	33,117	50%
Executives	20,283	30,702	51%
Sales	12,943	13,002	0%
Administrative Support	19,437	19,807	2%
BLUE-COLLAR WORKERS			
Precision Production	21,028	20,116	-4%
Operators, Fabricators, & Laborers	37,702	53,936	43%
FARMING, FORESTRY, AND FISHING	12,251	12,588	3%
SERVICE	48,180	51,797	8%
TOTAL WITH OCCUPATION	165,234	221,731	34%
TOTAL WITHOUT OCCUPATION	261,694	498,583	91%
GRAND TOTAL	426,928	730,314	69%

Note: Predicted numbers in FY 1996 are based on linear projections (from the years between 1972 and 1991), and are kept within numerical limits on nonexempt categories. Humanitarian admissions are not included.

Source: Greenwood, M.; Ziel, F.A. 1997. *The Impact of the Immigration Act of 1990 on U.S. Immigration*. Washington, DC: U.S. Commission on Immigration Reform.

the Commission calculated simple linear projections for all of the admission categories now subject to the worldwide ceiling on admissions. Data from FY 1972-1991 were analyzed and the trends identified, then projected forward to FY 1996. This analysis, therefore, paints a "what-if" picture of what today's immigration might have looked like if past trends had continued unaffected by IMMACT [see table above].

The actual total number of admissions under the worldwide ceiling in FY 1996 was 720,314 which—compared to the projected figure of

426,929—was 69 percent greater than would have been expected without IMMACT. Admissions were greater than the projected figure because IMMACT increased numerically-limited family, employment, and diversity admissions. The numerically-exempt admissions for the immediate relatives of U.S. citizens would have grown between 1992 and 1996 even without IMMACT. This analysis does not include humanitarian admissions.

Of immigrants who reported an occupation, the actual admissions in FY 1996 were 221,731 which—compared to the projected figure of 165,234—was 34 percent greater than would have been expected if IMMACT had not gone into effect. By contrast, nonworking immigrants experienced a 91 percent increase of actual over projected. This finding is not surprising as FY 1996 family admissions were significantly higher than would have been permissible under previous law. In part this was because IMMACT permitted unused FY 1995 employment-based numbers to be transferred to the FY 1996 family categories. In combination with a growth in immediate relatives (including those who would normally have been admitted in FY 1995 but were caught in processing delays), the additional visas meant more spouses and minor children entered. These immigrants are the least likely to be employed.

As might be anticipated, IMMACT's new emphasis on admitting highly-educated and skilled persons led to growth in professional occupations among those who reported an occupation. As stated above, there was an overall 34 percent increase in persons reporting an occupation. This increase was not evenly distributed, however. The number of health professionals, for example, was projected to be 10,244, but at 18,985 was 85 percent greater. The number of executives also shows a higher than expected increase. Interestingly, projections not shown here indicate that within the employment-based category, family members (beneficiaries) of the principals show the greatest growth in professional occupations. This suggests that when principals with more skills are admitted, they

bring with them spouses who are, likewise, more skilled than in the past. Further, projections not shown here indicate that the skill requirement for permanent diversity immigrants makes for more highly-skilled admissions from eligible countries. In short, IMMACT increased both the numbers of more skilled admissions and their share of immigrants admitted.

Most nonprofessional white-collar and blue-collar occupations show very little or no growth over what might have occurred without IMMACT. The one notable exception is a greater-than-expected increase in the number of "Operators, Fabricators, and Laborers." There were 53,936 admissions in these occupations compared to the 37,702 that were projected. As the employment-based access for persons with these occupations is highly limited, it appears that much of this increase is attributable to family-based admissions. It is unclear from the data, however, why this pattern has emerged.

Earnings. According to the NIS survey, the median earnings of all male immigrants admitted in 1996 was $15,600 and for women was $11,960, lower than the median earnings for natives. Compared to the earnings in their last country of residence, male immigrants experienced a 59 percent increase and women a 45 increase in earnings upon admission to the United States. Differences in earnings are, as should be expected, substantial by admission class. Many employment-based immigrants earn a median income of $36,400 on the date of their admission to LPR status, while the sibling or spouse of an LPR earns $11,750 and the spouse of a citizen earns $18,200.

---

[4] National Research Council. (Smith, J.P.; Edmonston, B. eds.). 1997. *The New Americans: Economic, Demographic, and Fiscal Effects of Immigration*. Washington, DC: National Academy Press.

Effects on the Economy

An independent evaluation of immigration by a panel of eminent social scientists at the National Research Council [NRC], sponsored by the Commission,[4] found that immigration has a positive economic impact on the national level. However, the NRC panel's findings confirm the by now commonplace conclusion that there are tangible costs to certain sectors of the labor market and certain communities. This reinforces the Commission's conclusions on the need for a well-regulated system of immigrant admissions, as well as the need for attention to means of improving integration and reducing friction between newcomers and established residents.

The NRC panel estimates that immigrants may add $1-10 billion directly to the national economy each year, a small but positive amount in a $7.6 trillion economy. Many consumers, business owners, and investors benefit from the immigrant labor force. Recent newcomers may be willing to work for lower wages than other U.S. workers, although, with the exception of many immigrants with less than a high school education, most immigrants tend to earn as much as natives after a decade. Many others in the economy benefit, particularly those who do work that is complementary to that performed by immigrants. Immigrants provide the labor that has kept viable entire segments of certain labor-intensive industries, such as garment and shoemaking. Many immigrant entrepreneurs expand trade with foreign countries from which they come, and the language and cultural expertise of many immigrant employees are valuable to U.S. companies doing business abroad.

Immigrants also contribute to the economic revitalization of the communities in which they live. As middle-class natives have left the

inner cities, immigrant newcomers have settled, established businesses, bought homes, and otherwise invested in these areas. Gateway cities, such as New York and Los Angeles, have benefitted particularly from this urban renewal. At the same time, these cities face new challenges related to immigration. Growing immigrant communities require local school systems (some of which may have otherwise faced declining enrollments) to provide sufficient classroom space and teachers. They must also develop programs to teach children who are without English skills or prior education. Overcrowded housing, drug trafficking, gang violence, sweatshops, and public health problems also may be found in many of these inner-city communities.[5]

Immigration particularly affects certain U.S. workers. The NRC panel finds that workers with less than twelve years of education are the most adversely affected by low-skilled immigrant workers. Immigrants may have reduced substantially the wages of high school dropouts, who are about one-tenth of the workforce, by 5 percent nationwide. This is a sizable impact on a group that was already poorly paid before the loss in real earnings it experienced over the past two decades. Most often it is the foreign-born worker, particularly in labor markets with large numbers of immigrants who experience the greatest competition.[6] While the education and skill level of most U.S. workers differs significantly from those of most immigrants (and therefore they are not competing for the same jobs), the new arrivals are often direct substitutes for immigrants who arrived a short time before them.[7]

The evidence on the impact of immigration on native-born minorities nationwide is less clear. The NRC concluded that in the aggregate, the economic opportunities of African Americans are not reduced by immigration because African Americans and immigrants tend to be in different labor markets and reside in different cities. Other research finds small, adverse effects on African Americans.[8] These effects are found most strongly when low-skilled minority workers compete with low-skilled immigrant workers in the same industries and the same geographic areas.

The fiscal effects of immigration also are complicated. Generally, the impacts on the federal government are favorable compared to those on state and local governments. Most studies show that at the federal level, the foreign-born pay more in taxes than they receive in services. When spread across all taxpayers, this characteristic represents a very small, but positive, benefit. At the local level, however, immigrants often represent a net fiscal cost, in some cases a substantial one. Research on the resident illegal alien population finds the clearest examples of fiscal costs to states and localities.[9] In general, much of the negative effect is related to school costs that are considerable because of the larger size of many immigrant families. Although funds spent on education may be considered an investment, not just a fiscal burden, the payoff is not realized for many years.

Education affects fiscal impacts in a second way. Ultimately, the economic success and fiscal contributions of immigrants are determined by their educational level. The NRC panel found that immigrants who complete high school and beyond generally represent a more favorable balance of fiscal costs and contributions than do those with little or no education. Even over their lifetimes, immigrants without education are unlikely to contribute sufficient tax revenues to offset their use of services. Both groups of immigrants tend to use public services in a similar fashion, particularly as related to the schooling of their children, but the more educated immigrants tend to earn more and pay higher taxes.

Educational differences also explain why certain states and localities are more adversely affected by immigration than are others. California immigrants represent a sizeable tax burden (estimated at almost $1,200 per native-headed family per year) while New Jersey immigrants represent a more modest tax burden (estimated to be $232 per native-headed family per year). The difference can be explained largely by the differences in the average educational level of the immigrants residing in these states.[10]

English language ability also affects the economic success and fiscal impacts of immigrants. In the 1990 Census, 47 percent of the foreign-born more than 5 years of age reported not speaking English "very well." Individuals with poor English language skills tend to be confined to the lowest levels of the U.S. job market. By contrast, ability in spoken English markedly improves immigrants' earnings, especially for Hispanic and Asian adult immigrants.[11] English read-

ing comprehension also has been found to improve the earnings of young immigrant adults.[12]

Population Growth and Natural Resources

In recent years there have been about 800,000 legal admissions and an additional estimated 200,000 to 300,000 unauthorized entries, but the net annual increase of the foreign-born population is about 700,000 each year due to return migration and mortality.[13] In 1996, the foreign-born population was 24.6 million, 9.3 percent of the U.S. population. Recent arrivals make up a large share of the resident foreign-born population; about 28 percent arrived after 1990, and an additional 35 percent during the 1980s.

It is estimated that international migration makes up somewhere between one-quarter and one-third of net annual population increase. Given current demographic trends and noting that much can happen to alter long-range forecasts, the U.S. Census Bureau projects the population to increase by 50 percent between 1995 and 2050. Immigration is likely to become a larger proportion of the net increase.[14]

The NRC report also presented estimates of population growth. It found that *without* immigration since 1950, the U.S. population would have been 14 percent smaller than its 1995 size of 263 million. The NRC projected the population to the year 2050 after making certain assumptions about mortality, fertility, and rates of group inter-mar-

riage. According to the projection based on these assumptions, the U.S. population would increase by 124 million persons to 387 million, with immigration responsible for two-thirds (82 million) of the increase. Of this 82 million, 45 million are immigrants and an additional 37 million increase is due to their higher assumed fertility.

Immigration affects the age structure as well as the overall population. The NRC panel projected that under current immigration policy, kindergarten through grade eight school enrollment in 2050 would be 17 percent higher than it was in 1995. High school enrollment would rise from 14.0 million in 1995 to 20.3 million in 2050. Immigration also has small effects on the proportion of the population that is elderly. No matter which immigration policies are adopted, according to the NRC, the number of persons aged 65 years and older will double between 1995 and 2050. However, the proportion of older people in the total population will be somewhat smaller with immigration.

The NRC panel's projection of the ethnic distribution of the U.S. population in 2050 shows the Hispanic population increasing from 10 to 25 percent and the Asian population from 3 to 8 percent of the population. These projections are dependent on today's rates of group intermarriage and how persons report their ethnicity. It may be that, like children of immigrants who arrived in the last century, descendents of today's immigrants will choose to report their ethnicity as being different from that of their parents, and that today's ethnic categories will not accurately describe tomorrow's populations.

What broader implications do these growth figures have? Some analysts argue that high immigration levels mean an abundant supply of youthful workers who will be a substantial spur to the economy. From this perspective, population growth is an engine for technological progress and the means to solve environmental problems, effectively spawning change out of necessity. Proponents of

this view argue that human resourcefulness has dealt with population growth in the past and the solutions often have left us better off. Adding more people may "cause us more problems, but at the same time there will be more people to solve these problems."[15]

Others are concerned about the negative consequences of population growth, particularly on the environment, infrastructure, and services.[16] They see population growth as imposing pressures on our natural resources and quality of life, raising special concerns in the arid regions of the southwest or sites of industries relocating to the south central states.[17] Those concerned argue that our future well-being depends upon both conservation, and stabilizing population growth.[18]

This debate primarily concerns total U.S. population growth, which is strongly influenced by immigration. Still, there is little or no information about whether immigrants have *differential* impacts distinct from the population increase they produce on the U.S. environment.[19]

The Commission did find that rapid inflows of immigrants can pose difficulties for those who must plan for community growth. Schools sometimes receive large numbers of new immigrant students that had not been planned for. Housing and infrastructure development

may not be adequate in affected urban and rural communities.[20] New immigrant destinations, sometimes to areas that have not had new immigrants for a century or more, can put particular stress on communities that have experienced rapid growth in the past decade.

Foreign Policy and National Security Interests

Immigration matters frequently are intertwined with foreign policy and national security. Today, migration and refugee issues are matters of high international politics engaging the heads of state involved in defense, internal security, and external relations.[21] International migration intersects with foreign policy in two principal ways. The U.N. Security Council has acknowledged that migration can pose threats to international peace and security through economic or social instability or humanitarian disasters. Migration can also build positive relations with other countries and thereby promote national security. As a consequence, migration itself requires bilateral and international attention to help address the causes and consequences of movements of people.

During the Cold War, a foreign policy priority was the destabilizing of Communist regimes. Refugee policy was often a tool to achieve that strategic goal, for instance, by encouraging the flow of migrants from Eastern Europe or Cuba. Elsewhere, political, economic, and military involvement in Southeast Asia and the Dominican Republic had significant migration consequences, as large numbers of Southeast Asians and Dominicans ended up as refugees and immigrants

to the U.S. These foreign policy priorities generally have had significant immigration consequences years later.

Alternatively, immigration concerns sometimes have played a significant role in U.S. foreign policy, especially when mass movements to the U.S. are feared. A stated rationale for U.S. Central-American policy in the 1980s was to prevent a mass movement that would occur if anti-American Marxist dictatorships were established in Central America. One of the explicit reasons for the military intervention in Haiti in 1994 was to restrain the flow of migrants onto U.S. shores. And, although the U.S. does not officially maintain relations with Cuba, migration concerns gained priority over diplomatic ones leading to negotiations on the Cuban Migration Agreement and to a reversal of policy regarding the interdiction of Cuban migrants.

Some observers believe that environmental causes now rival economic and political instability as a major source of forced migration throughout the world. There are estimates that as many as one-hundred million people may be displaced, in part, because of degradation of land and natural resources. "That will increase the pressure to migrate to places like the United States."[22] The pervasive deterioration of Mexico's rural drylands may contribute to between 700,000 and 900,000 people a year leaving rural areas.[23] Environmental degradation in Mexico, Haiti, and Central America also are believed to have migration consequences for the U.S. Often environmental problems intersect with other causes. One researcher argues that migrants from Haiti may be considered "environmental refugees" because the root causes of their migrations are land deg-

radation and the Haitian government's unwillingness to act in the interest of the general population."[24]

Stabilizing economic growth and democracy may be an effective means of reducing migration pressures. The Commission for the Study of International Migration and Cooperative Economic Development[25] concluded that, over the long run of a generation or more, trade and investment are likely to reduce migration pressures. Supporters of the North American Free Trade Agreement [NAFTA] argued that NAFTA-related development eventually will reduce unauthorized Mexican migration. The U.S. has provided the reinstalled democratically-elected government of Haiti with a great deal of rehabilitation assistance that should aid the stability of that country.

CONCLUSION

Properly-regulated immigration and immigrant policy serves the national interest by ensuring the entry of those who will contribute most to our society and helping lawful newcomers adjust to life in the United States. It must give due consideration to shifting economic realities. A well-regulated system sets priorities for admission; facilitates nuclear family reunification; gives employers access to a global labor market while protecting U.S. workers; helps to generate jobs and economic growth; and fulfills our commitment to resettle refugees as one of several elements of humanitarian protection of the persecuted.

AMERICANIZATION AND INTEGRATION OF IMMIGRANTS

A DECLARATION OF PRINCIPLES AND VALUES

Immigration to the United States has created one of the world's most successful multiethnic nations. We believe these truths constitute the distinctive characteristics of American nationality:

- American unity depends upon a widely-held belief in the principles and values embodied in the American Constitution and their fulfillment in practice: equal protection and justice under the law; freedom of speech and religion; and representative government;

- Lawfully-admitted newcomers of any ancestral nationality—without regard to race, ethnicity, or religion—truly become Americans when they give allegiance to these principles and values;

- Ethnic and religious diversity based on personal freedom is compatible with national unity; and

- The nation is strengthened when those who live in it communicate effectively with each other in English, even as many persons retain or acquire the ability to communicate in other languages.

As long as we live by these principles and help newcomers to learn and practice them, we will continue to be a nation that benefits from substantial but well-regulated immigration. We must pay attention

to our core values, as we have tried to do in our recommendations throughout this report. Then, we will continue to realize the lofty goal of *E Pluribus Unum*.[1]

AMERICANIZATION

The Commission reiterates its call for the Americanization of new immigrants.

The Commission reiterates its call for the Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy and equal opportunity. The U.S. has fought for the principles of individual rights and equal protection under the law, notions that now apply to all our residents. We have long recognized that immigrants are entitled to the full protection of our Constitution and laws. The U.S. also has the sovereign right to impose appropriate obligations on immigrants.

In our 1995 report to Congress, the Commission called for a new commitment to Americanization. In a public speech that same year, Barbara Jordan, our late chair, noted: "That word earned a bad reputation when it was stolen by racists and xenophobes in the 1920s. But it is our word, and we are taking it back." Americanization is the process of integration by which immigrants become part of our communities and by which our communities and the nation learn from and adapt to their presence.

This process enhances our unity by focusing on what is important, through acknowledging that the many real differences among us as individuals do not alter our essential character as a nation.

---

[1] Our national motto, *E Pluribus Unum*, "from many, one," was originally conceived to denote the union of the thirteen states into one nation. Throughout our history, *E Pluribus Unum* also has come to mean the vital unity of our national community founded on individual freedom and the diversity that flows from it.

This Americanization process depends on a set of expectations that the United States, which chooses to invite legal immigrants, legitimately has of newcomers. It applies equally to the expectations immigrants legitimately have of their new home.

The Commission proposes that the principles of Americanization be made more explicit through the covenant between immigrant and citizens. These principles are not mere abstractions. They can form a covenant between ourselves and immigrant newcomers. As President Johnson eloquently stated in 1965:

> They came here—the exile and the stranger. . . . They made a covenant with this land. Conceived in justice, written in liberty, bound in union, it was meant one day to inspire the hopes of all mankind; and it binds us still. If we keep its terms, we shall flourish.

We have not always abided by its terms, but the ideal of a covenant between immigrant and nation still captures the essence of Americanization. Immigrants become part of us, and we grow and become the stronger for having embraced them. In this spirit, the Commission sees the covenant between immigrants and ourselves as:

> ***Voluntary***. Immigration to the United States—a benefit to both citizens and immigrants—is not an entitlement and Americanization cannot be forced. We as a nation choose to admit immigrants because we find lawful immigration serves our interests in many ways. Likewise, no one requires immigrants to come here or to become citizens; they choose to come and, if they naturalize, they choose to become a part of our polity.

Mutual and reciprocal. Immigration presents mutual obligations. Immigrants must accept the obligations we impose—to obey our laws, to pay taxes, to respect other cultures and ethnic groups. At the same time, citizens incur obligations to provide an environment in which newcomers can become fully participating members of our society. We must not exclude them from our community nor bar them from the polity after admission. This obligation to immigrants by no means excuses us from our obligations to our own disadvantaged populations. To the extent that immigration poses undue burdens on our communities, our citizenry, or immigrants themselves, we have an obligation to recognize and address them.

Thus the United States assumes an obligation to those it admits, as immigrants assume an obligation to this country they chose. Having affirmatively admitted the newcomer, the federal government necessarily extends civic and societal rights. Unfortunately recent legislative changes effectively have excluded immigrants from the public safety net until such time as they become naturalized citizens. This Commission previously recommended against such action. We believe it is likely that these changes will lead to greater problems both for immigrants and for the communities in which they live. Legislation that leads immigrants to seek citizenship to protect eligibility for social benefits, rather than out of commitment to our polity, provides the wrong incentive. The effect is not to exalt citizenship, but to diminish it.

Individual, not collective. The United States is a nation founded on the proposition that each individual is born with certain rights and that the purpose of government is to secure these rights. The United States admits immigrants as individuals (or individual members of families). As long as the United States continues to emphasize the rights of

individuals over those of groups, we need not fear that the diversity brought by immigration will lead to ethnic division or disunity. Of course, the right to assemble and join with others is a fundamental right of all Americans, immigrants included. However, unlike other countries, including those from which many immigrants come, rights in the United States are not defined by ethnicity, religion, or membership in any group; nor can immigrants be denied rights because they are members of a particular ethnic, religious, or political group.

The Commission believes that the federal government should take the lead and invite states and local governments and the private sector to join in promoting Americanization**.** For example, "I Am an American Day" was once widely celebrated in public schools and local communities. Recent immigration legislation mandates naturalization ceremonies on the 4th of July. While the federal government cannot and should not be the sole instrument of Americanization, it can provide important leadership in supporting the implementation of programs designed to promote full integration of newcomers.

To help achieve full integration of newcomers, the Commission calls upon federal, state, and local governments to provide renewed leadership and resources to a program to promote Americanization that requires:

- Developing capacities to orient both newcomers and receiving communities;

- Educating newcomers in English language skills and our core civic values; and

- Revisiting the meaning and conferral of citizenship to ensure the integrity of the naturalization process.

The Commission recommends that the federal government take an active role in helping newcomers become self-reliant: orienting immigrants and receiving communities about their mutual rights and responsibilities, providing information they need for successful integration, and encouraging the development of local capacities to mediate when divisions occur between groups.

ORIENTATION

The Commission recommends that the federal, state, and local governments take an active role in helping newcomers become self-reliant: orienting immigrants and receiving communities as to their mutual rights and responsibilities, providing information they need for successful integration, and encouraging the development of local capacities to mediate when divisions occur between groups. Information and orientation must be provided both to immigrants and to their receiving communities. The experience of "newcomer schools" is that providing coordinated information and advice on life in the United States accelerates the integration of newcomers, which, in turn, decreases the negative impacts on communities. Information on expected impacts and successful programs can help localities foster immigrant integration and mediate differences to avoid community conflicts.

More specifically, to integrate into American society, immigrants need information on their legal rights and obligations, on American core civic beliefs, on how to access services, and on immigration-related requirements. Communities require information on the numbers and characteristics of immigrants arriving in their midst, the eligibility of newcomers for various services, the legal responsibilities of state and local government agencies, and similar matters. The Commission believes the federal government should help immigrants and local communities by:

- **Giving orientation materials to legal immigrants upon admission** that include, but are not limited to: a welcoming greeting; a brief discussion of U.S. history, law, and principles of U.S. democracy; tools to help the immigrant locate and use services for which they are eligible; and other immigration-related information and documents. All immigrants would receive the same materials. The packets would

be available in English and the main immigrant languages. It is not the Commission's intent to prescribe all parts of an orientation packet but, rather, to suggest the most important information and key resources that should be included.

Welcoming statement. The Welcoming Statement would congratulate immigrants on their decision to become permanent residents of the United States. It also would summarize the basic principles that all Americans embrace.

Example of a Welcoming Statement

Congratulations on your decision to immigrate to the United States of America. Best wishes for a successful settlement in your new home. This is a proud country of individual freedom, opportunity, and diversity with a long tradition of immigration. Finding success and opportunity in the United States can be difficult. We realize that immigrants face many challenges as they become self-reliant, such as learning a new language and adjusting to new circumstances. The U.S. has learned from its tradition of immigration that patience, tolerance, and adaptability are required from each and every one of us.

Basic American principles that you are asked to embrace include: a commitment to serve the best interests of the United States and the community in which you live; knowledge of and respect for our laws and democratic institutions; respect for freedom of speech and religion; and a commitment not to discriminate against others on the basis of nationality, race, sex, or religion. The excerpts from the U.S. history and law section of your orientation packet should serve to illustrate the meaning of these important principles.

We the people of the United States welcome you.

Example of Documents on the Founding Principles

On July 4, 1776, the Continental Congress adopted a Declaration drafted by Thomas Jefferson that defined the commitment of a new nation to the principles of liberty and justice for all:

> *We hold these Truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are Life, Liberty, and the Pursuit of Happiness—That to secure these rights, Governments are instituted among Men, deriving their just Powers from the Consent of the Governed. . . .*

The greatest contradiction in the new nation's founding was the institution of human slavery, which ended only after a bloody civil war (1860-1864). After the decisive battle at Gettysburg, in 1863, Abraham Lincoln dedicated the cemetery, ending with these words:

> *[W]e here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.*

After the Civil War, the effort to live up to the promises of the founding principles intensified. In 1872, Susan B. Anthony was arrested for attempting to vote in a Presidential election. Her speech on the rights of women was an important step toward gaining women the vote:

> *The preamble of the federal Constitution says . . . It was we, the people; not we, the white male citizens; nor yet we, the male citizens; but we, the whole people, who formed the Union. And we formed it, not to give the blessings of liberty, but to secure them; not the half of ourselves and our posterity; but to the whole people —women as well as men.*

Way into the twentieth century, the founding principles continue to challenge Americans. In 1963, the Reverend Dr. Martin Luther King, Jr. led a peaceful March on Washington, and spoke on the steps of the Lincoln Memorial in the cause of civil rights.

> *When the architects of our republic wrote the magnificent words of the Constitution and the Declaration of Independence, they were signing a promissory note to which every American was to fall heir. This note was a promise that all men would be guaranteed the unalienable rights of life, liberty, and the pursuit of happiness . . .*
>
> *I have a dream that one day this nation will rise up and live out the true meaning of its creed: "We hold these truths to be self-evident; that all men are created equal. . . . I have a dream that my four little children will one day live in a nation where they will not be judged by the color of their skin but by the content of their character . . . And if America is to be a great nation this must become true.*

U.S. history, law, and principles of democracy. This would include a brief history of the United States and of the principles listed in the welcoming statement, followed by excerpts from relevant historical documents. It would stress that American civic culture is based on a trust in ordinary people's ability to govern themselves through their elected representatives who are then accountable to the people, on the right of all members of the polity to participate in public life as equals, and on the freedom of individual members of the community to differ from each other in religion and other private matters.

Tools for settlement. This section would emphasize the development of self-reliance. It would include general information and checklists to aid immigrants in finding and using services in their community that may help them in developing economic independence.

Example of Tools for Settlement

What to expect upon immigration: information to orient newcomers on federal policies and services, such as a pre-/ post-arrival checklist on admissions, information for those adjusting status on new rights and responsibilities as permanent residents, reminder to register for military service if necessary, the role of government agencies and service providers; consumer protection and tax policies;

How to secure basic needs: information on housing, employment, education and language training, health, transportation, police and fire protection, managing finances, and cultural adjustment;

Finding assistance and advice: telephone numbers for the local information clearinghouses, government agencies; documents listing weight and measurement conversions, U.S. holidays, instructions in using the telephone and postal systems; a U.S. map;

Getting involved in the community: listings of community organizations (e.g., civic, sports, arts) and volunteer opportunities.

Immigration information and documents. This section would provide necessary immigration forms, information on naturalization, and a card for non-English-speaking immigrants to indicate their need for an interpreter.

- **Encouraging state governments to establish information clearinghouses in major immigrant receiving communities.** The Commission recommends that the federal government provide modest incentive grants to states to encourage them to establish and maintain local resources that would provide information to immigrants and local communities. For example, local information clearinghouses could provide information to immigrants on rights and responsibilities, naturalization, education and training, and the world of work. They could have materials available on tenant law and renter/landlord rights and responsibilities. They could spell out how U.S. family law (regarding marriage and prohibiting spouse and child abuse, polygamy, and female genital mutilation, etc.) may differ from other cultures. They could provide information on public life (driving, insurance, hunting/fishing licences, law enforcement, consumer protection, etc.). They could also provide information to local public and private organizations about immigrants, e.g., documentation, culture/background, eligibility status for programs, work authorization verification.

  The resource centers could develop, translate and disseminate materials; foster partnerships among immigrant interest groups, ethnic churches, and service providers (advisory boards, taskforces, planning boards, coalitions); and develop volunteer networks in immigrant communities to help newly-arriving immigrants. These efforts could help reduce community tensions arising from immigration by providing accurate information and helping communities find ways to mediate these tensions. The resource centers could also

provide information on model programs implemented by businesses, service agencies, and others.

The Office of Refugee Resettlement in the Department of Health and Human Services, which already provides funding for refugee services, could administer this grant program. Each state receiving funds would designate the local structure through which the funding would be administered as part of its application for funds. Some states are likely to designate the state refugee coordinator's office, but others may designate the state education department. States had similar flexibility when they received funds under the State Legalization Impact Assistance Grant [SLIAG] program.

These already-existing structures could easily integrate the proposed services with only modest financial increments. Based on its consultations, the Commission believes that an annual appropriation of $30-35 million would cover development of orientation materials and underwrite services in forty to fifty targeted communities. The monies should be administered flexibly, not as a formula to each state. Targeted areas should include those with historically significant numbers of immigrants as well as communities experiencing a sudden growth in immigrant arrivals. (In Garden City, Kansas, for example, the Commission observed how the arrival of new meatpacking plants changed the population from one with few foreign-born residents a decade ago to one with a sizeable immigrant component today.)

- **Promoting public/private partnerships to orient and assist immigrants in adapting to life in the United States.** The Commission previously has called for a renewed public/private partnership in the Americanization of immigrants. While the federal government makes the decisions about how many and which immigrants will be admitted to the

United States, the actual process of integration takes place in local communities. Local government, schools, businesses, religious institutions, ethnic associations, and other groups play important roles in the Americanization process.

Project Vida in El Paso provides medical services to the Latino border community. Funded by the Presbyterian Church and public/private grants and contracts, Vida developed "one-stop shopping" for primary health care, education, housing, and other social services. It built 20 affordable rental units; and helped to generate an increase in local elementary school reading scores.

The Commission urges the federal government to assemble leaders from the public and private sectors at the federal, state, and local levels to discuss ways to invigorate a public/private partnership to promote Americanization. The participants should include representatives of state and local educational systems, businesses, labor, local governments, and community organizations. The meeting would address ways to enhance resources for instruction in English language acquisition, civic understanding, and workplace skills. The federal grant program described above also could help promote more coordinated efforts at the local level by establishing advisory structures representing the various public and private institutions with interest in immigration matters.

The Fannie Mae Foundation built a model public/private initiative with community-based organizations, public officials, and lenders to facilitate home ownership and naturalization for immigrants.

EDUCATION

Education is the principal tool of Americanization. Local educational institutions have the primary responsibility for educating immigrants. However, there is a federal role in promoting and funding English language acquisition and other academic programs for both immigrant children and adults.

The Commission urges a renewed commitment to the education of immigrant children. The number of school-aged children of immigrants is growing and expected to increase dramatically. These children, mostly young, speak more than 150 different languages; many have difficulty communicating in English. They are enrolled in public schools as well as in secular and religious private schools through the country.

In addition to the problems other students have, immigrant children face particular problems in gaining an education—often because of language difficulties. The 1990 Census shows that 87 percent of immigrant children attended high school as compared to 93 percent of natives. More than one-fourth of Mexican immigrant youth between ages 15 and 17 were not in school in 1990. While some dropped out, others never "dropped in" to school in the first place.

The Commission urges a renewed commitment to the education of immigrant children.

Immigrant children often come from countries with customs, traditions, and social and governmental structures that differ from those they encounter in the U.S.; some have little or no formal education and no understanding of the American school system; some arrive with personal experiences of trauma and war; many older children come from countries where school ends at a younger age; many experience lengthy delays in being mainstreamed into regular English-speaking classes; and some do not receive appropriate-level instruction in other academic subjects while they are learning English.

Immigrant children also bring strengths to American society. For example, their native-language skills contribute to building the future multilingual workforce needed in a global economy; sharing of their cultural heritage will promote the sensitivity of that workforce as it interacts in a worldwide marketplace. Many immigrant children who enroll in school and then remain to graduate do well academically. These immigrant children are more likely than natives to prepare for, attend, and complete college.[2] The key, however, is helping them achieve sufficient English proficiency to be able to participate.

The Commission emphasizes that rapid acquisition of English should be the paramount goal of any immigrant language instruction pro-

gram. English is the most critical of basic skills for successful integration. English can be taught to children in many ways. Effective programs share certain common characteristics. Based on a review of these programs, the Commission emphasizes the need to*:*

The Commission emphasizes that rapid acquisition of English should be the paramount goal of any immigrant language instruction program.

- **Conduct regular evaluations of students' English competence and their ability to apply it to academic subjects.** Such evaluations will ensure placement of immigrant children into regular English-speaking classes as soon as they are prepared. Regular evaluation also will highlight strengths and weaknesses in educational programs and provide insight on improvements that are needed to ensure timely English acquisition.

- **Collect and analyze data regularly on students, their linguistic and academic performance, and the method of instruction.** Presently, federal, state, and local governments fail to collect and analyze adequate, uniform, data on bilingual and other forms of English instruction. Such failure hinders overall evaluation and the responsible allocation of government funds. A 1997 National Research Council report[3] pointed out the need for new systems to support data collection and research in this area. The NRC recommended establishment of a new Department of Education Advisory Committee on Research on English-Language Learners, urged the National Center for Education Statistics to take the lead in collecting data on students and programs, and recommended that the Office of Bilingual Education and Minority Language Affairs take the lead in developing and evaluating programs to enhance teacher development.

---

[3] National Research Council (August, D; Hakuta, K. eds.). 1997. *Improving Schooling for Language-Minority Children: A Research Agenda.* Washington, DC: National Academy Press.

- **Include appropriate grade-level instruction in other academic disciplines.** Coordination with teachers, curricula, and instruction outside of English acquisition will promote students' mastery of regular subject matter while they learn English.

- **Involve parents of immigrant students in their schooling.** A characteristic of many of the most successful language acquisition programs is the active involvement of parents in the education of their children. Such "family literacy" models include programs that promote frequent parent-teacher conferences and that also encourage non-English-speaking parents to enroll in English as a Second Language [ESL] programs. Some of the adult programs are offered at the local school in the evenings.

Seattle's Sharples Center teaches refugee students with limited or no English proficiency in grades six through twelve. They are grouped by English language ability, not age. Because of high demand, they usually can stay for only six months or less. The program focuses on preventing subsequent low academic perfor-mance and also pre-venting the high dropout rates that occur when students with limited English proficiency are mainstreamed too soon.

The Commission encourages programs that are responsive to the needs of immigrant children and an orientation to United States school systems and the community, such as we have seen in "newcomer schools." Newcomer schools must not isolate immigrant newcomers. Instead, they must be transitional and actively promote the timely integration of students into mainstream schools. Successful programs recognize the special needs of immigrant children, particularly refugees. They share information among resettlement programs and school administrators and among English acquisition and regular classroom teachers. Along with English and other academic subjects, newcomer schools teach basic school survival and living skills (such as how the local transportation system works and how to shop for food) and develop intercultural communications. Some also provide access to a wide range of support services, such as health screenings and immunizations.

The Commission encourages programs that are responsive to immigrant children's needs and an orientation to United States school systems and the community.

The Commission recommends the revival and emphasis on instruction of all kindergarten through grade twelve students in the common civic culture that is essential to citizenship. An understanding

of the history of the United States and the principles and practices of our government are essential for all students, immigrants and natives alike. Americanization requires a renewed emphasis on the common core of civic culture that unites individuals from many ethnic and racial groups. Civics instruction teaches students both the responsibilities and the rights of United States citizenship. Civics education also can help immigrant students turning eighteen to prepare for naturalization. The Commission recommends that local school boards institute civics programs that:

San Francisco's Newcomer High School was the nation's first high school devoted entirely to immigrants. Students with less than six years of education and/or poor English skills may attend for up to a year of intensive instruction based on their English ability rather than on their age. Before they are mainstreamed, students are taken to see their new school and meet their new teachers.

- Teach that the U.S. is united by the constitutional principles of individual rights and equal justice under the law;

- Restore the emphasis on such traditional American leaders as Washington, Jefferson, and Lincoln, who defined the American promise of liberty and equality for all, and incorporate other heroes and heroines, such as Sojourner Truth, Susan B. Anthony, Martin Luther King, Jr., Franklin Roosevelt, and Barbara Jordan, who expanded their promise to all Americans;

- Stress the importance of civic holidays and of American symbols and rituals, for example, the flag and the Pledge of Allegiance.

The Commission recommends the revival and emphasis on instruction of all kindergarten through grade twelve students in the common civic culture that is essential to citizenship.

Civics instruction in public schools should be rooted in the Declaration of Independence, the Constitution—particularly the Preamble, the Bill of Rights, and the Fourteenth Amendment. Emphasizing the ideals in these documents is in no way a distortion of U.S. history. Instruction in the history of the United States, as a unique engine of human liberty notwithstanding its faults, is an indispensable foundation for solid civics training for all Americans.

The Commission emphasizes the urgent need to recruit, train, and provide support to teachers who work with immigrant students.

There is a disturbing shortage of qualified teachers for children with limited English proficiency, of teacher training programs for producing such teachers, and of other support for effective English acquisition instruction. More than 50 percent of teachers in current bilingual education programs have no formal education in teaching students with limited English skills. Teachers are often unprepared and untrained in understanding how the cultural background and experiences of immigrant children may affect their ability to learn. They need to understand that while many students quickly acquire skill in using and understanding English in social situations, acquiring academic proficiency in English takes longer.

All teachers of immigrant students—those who teach English and those who teach other academic subjects—need training to develop the most effective tools for imparting knowledge to students with limited English proficiency. Teachers also need help in understanding how best to involve immigrant parents who may themselves be limited in their command of English. Schools that have been effective in involving immigrant parents in their children's education tend to be more effective in retaining and educating students. To promote such involvement, teachers must be sensitive to differences in language and culture that may impede an immigrant parent's ability to participate in school activities.

The Commission emphasizes the urgent need to recruit, train, and provide support to teachers who work with immigrant students.

The Commission supports immigrant education funding that is based on a more accurate assessment of the impact of immigration on school systems and that is adequate to alleviate these impacts. Urban and rural schools often require federal assistance when confronted with large numbers of immigrant students. Current federal support comes through several unrelated funding streams: some is geared to particular instructional models; some is directed to address impacts of large numbers of new arrivals; however, most comes indirectly through monies targeted to schools with economically disadvantaged children who are performing poorly.

The Commission supports immigrant education funding that is based on a more accurate assessment of the impact of immigration on school systems and that is adequate to alleviate these impacts.

Washington, DC's public Bell Multicultural High School offers secondary and adult day/evening intensive English classes, vocational programs, career development, dropout prevention, technical preparation, and comprehensive math and science. Bell students have high attendance rates, high advanced placement exam scores, and high rates of continuing on to higher education. Last year counselors assisted more than 30 students to become citizens. Many staff are both immigrant and multilingual and, thus, can both empathize with students' transitions and support Bell's strong native language-maintenance program.

There are costs and responsibilities for language acquisition and immigrant education programs that are not now being met. We urge the federal government to do its fair share in meeting this challenge. The long-run costs of failure in terms of dropouts and poorly-educated adults will be far larger for the nation and local communities than the costs of such programs.

More specifically, we urge the federal government to:

- **Provide flexibility in federal funding for the teaching of English to immigrant students to achieve maximum local choice of instructional model.** The federal government should not mandate any one mode of instruction (e.g., bilingual education, English as a Second Language programs, immersion). Research indicates that no one pedagogical model for English instruction works more effectively than any other. What makes for success are: the commitment of the local school system to educate its English learners; well-trained teachers who are adept at English language instruction; involvement of parents; frequent evaluation of student language acquisition; and a plan for timely placements in mainstream programs.

- **Make funding contingent on performance outcomes—that is, English language acquisition and mastery of regular academic subject matter by students served in these programs.** School systems receiving funds because of large numbers of children with limited English proficiency and immigrant children should be held to rigorous performance standards. Incentives should promote—not impede—expeditious placement in regular, English-speaking, classes.

The Commission urges the federal, state, and local governments and private institutions to enhance educational opportunities for adult

immigrants. Education for basic skills and literacy in English is the major vehicle that integrates adult immigrants into American society and participation in its civic activities. Literate adults are more likely to participate in the workforce and twice as likely to participate in our democracy. Literate adults foster literacy in their children, and parents' educational levels positively affect their children's academic performance.

The Carlos Rosario Adult and Career Center in Washington DC. was for 25 years the only DC public school teaching English to adult foreigners, graduating classes as large as 650 students. Closed due to funding constraints, it reopened with private funding in a church in Chinatown. Courses are offered in computer use, nursing assistance, and GED.

According to the 1990 Census, a total of 5.8 million adults reported that they speak English "not well" or "not at all." This number continues to grow because of the entry of non-English-speaking immigrants. Researchers estimate that 600,000 adults with only limited or no English now enter the United States each year. Immigrants who are illiterate even in their native language or who have only a few years of schooling consequently are confined to employment in dead-end jobs.

The Commission urges the federal, state and local governments and private institutions to enhance educational opportunities for adult immigrants.

Adult education is severely underfunded. Available resources are inadequate to meet the demand for adult immigrant education, particularly for English proficiency and job skills. Enrollment in adult English as a Second Language classes increased 183 percent from 1980 to 1990; neither classes nor funding have kept pace with demand. In Massachusetts, a state widely recognized for its excellent adult education programs, an estimated 11,000 of the 16,000 on the waiting list for adult basic education are waiting for ESL services.

Three principal problems impede the capacity to expand opportunities for adult education. First, funding to subsidize courses is limited. Many adult immigrants are willing and able to pay some tuition for courses, expecting a positive return on this investment. However, given average income levels of uneducated, unskilled immigrants, they are unlikely to be able to cover the total costs of adult education courses.

The Resources Occupational Training Program in Brooklyn, New York, a nonprofit adult vocational training program, operates as an affiliate of the Catholic Migration Office of the Diocese of Brook-lyn. Launched in 1994 with seed money from an Italian businessman, it trains and places 98 percent of its immigrant students in well-paying jobs without government assistance.

Second, teacher training programs are limited, resulting in shortages in the number of qualified teachers. For example, in Massachusetts, there are only two training programs for teachers of ESL to adults and no Masters-level program for teachers of adult basic education. Many schools utilize volunteers to serve as tutors, but there is an insufficient number of trained teachers to provide guidance to these volunteer aides.

The third impediment relates to the general quality of adult education programs. The General Accounting Office [GAO] reported in 1995 that adult education and literacy programs funded by the U.S. Department of Education have no defined objectives, valid assessment instruments, or accurate program data.

In the early part of the twentieth century, state departments of education and local school boards played an active role in the Americanization of immigrants. They committed resources to adult education in evening and weekend classes because they recognized the importance of economic and civic incorporation into their communities. Similarly, many turn-of-the-century businesses participated in the Americanization movement, recognizing the benefits to their operations accruing from a literate, educated workforce.

Responding to requests from its limited English-speaking employees, the United Electric Control Corporation in Watertown, Massachusetts in 1992 launched an educational and vocational skills training program. Em-ployees are given time off from work to take courses in a program that is so successful that it led to the formation of a consortium of Boston area high-technology companies to provide the same services. In this case, the program was given a jump start by a federal workplace literacy program grant.

There has been a shift away from this once widely-held public perception of immigrant adult education as a local responsibility, with its local community- and school-based programs. The source of funding is federal and state (as compared to kindergarten through grade twelve education that is financed primarily through local taxes). While many local school districts continue to provide classrooms and other resources, others do not. In this setting of excess demand for adult education, volunteers and low-cost options do exist. Access to relatively inexpensive classroom space often is a major impediment to program implementation. But—even though publicly-owned classroom space is often available and unused during evening and weekend hours—such limitations persist.

In recognition of the benefits they receive from immigration, the Commission urges leaders from businesses and corporations to participate in skills training, English instruction, and civics education programs for immigrants. Religious schools and institutions, charities, foundations, community organizations, public and private schools, colleges and universities also can contribute resources, facilities, and expertise. All of these sectors benefit from having skilled, English-speaking workers and residents. For example, local school systems could open schools after hours to community groups providing English instruction on a volunteer basis, and businesses could provide employees the opportunity for such classes at the jobsite. Such public/private partnerships can contribute in many ways to a greater range of educational opportunities for immigrants.

The Boeing Company and the International Association of Machinists provide training and skills development to current and laid-off workers that includes English as a Second Language and professional English development. Boeing also provided in-kind production services for a community-based organization naturalization video series in eight languages.

NATURALIZATION

Naturalization is the most important act that a legal immigrant undertakes in the process of becoming an American. Taking this step confers upon the immigrant all the rights and responsibilities of civic and political participation that the United States has to offer (except becoming President). The Commission reiterates its belief that no action should be taken that detracts from the appeal of citizenship as an opportunity to become a member of the polity. The naturalization process must be credible, and it must be accorded the formality and ceremony appropriate to its importance.

Maid Bess, a contract apparel business in Salem, Virginia provides free on-site English instruction to its refugee employees with the help of a local refugee resettlement agency. Among its more than 400 employees, 17 national and ethnic groups are represented. On its annual "International Day," all employees are encour-aged to dress in the traditional costume of their native country or that of their ancestors.

The Commission believes that the current legal requirements for naturalization are appropriate, but improvements are needed in the means used to measure that an applicant meets these requirements.

To naturalize, legal immigrants must meet certain threshold requirements; these have remained remarkably consistent throughout our history. At present, to naturalize, a legal permanent residents must reside in the United States for five years (three years for spouses of

The Commission believes that the current legal requirements for naturalization are appropriate but improvements are needed in the means used to measure that ***an applicant meets these requirements.***

U.S. citizens and legal permanent residents who serve in the military); demonstrate the ability to read, write, speak, and understand English; pass a U.S. history and civics exam; be of good moral character; and take an oath of allegiance.

With regard to the specific legal requirements, the Commission supports:

- **Maintaining requirements that legal immigrants must reside in the United States for five years (three years for spouses of U.S. citizens and Lawful Permanent Residents who serve in the military) before naturalizing**. We believe five years is adequate for immigrants to embrace, understand, and demonstrate their knowledge of the principles of American democracy.

- **Improving the mechanisms used to demonstrate knowledge of U.S. history, civics, and English competence.** The Commission believes that the tests used in naturalization should seek to determine if applicants have a meaningful knowledge of U.S. history and civics and are able to communicate in English. The current tests do not adequately assess such understanding or abilities. The civics test, for example, relies on memorization of discrete facts rather than on substantive understanding of the basic concepts of civic participation.

  INS district offices vary significantly from each other in the methods by which they administer the test and in the threshold number of correct answers needed for passage. In some cases, examiners scale the tests to the perceived educational abilities of applicants. The lack of uniform standards governing whether an applicant has satisfactorily fulfilled the

The nonprofit Arlington Community Foundation in Virginia funds and organizes grassroots programs to assist immigrants in their transition to American society. It sponsors local community organizations, festivals, and focus groups to identify and address sources of tension be-tween longtime residents and newcomers. It also supports local initiatives to assist immigrant entre-preneurs and parents of school-age children to understand how American institutions work. In 1995, it founded the Washington Partnership for New Americans to encourage naturalization.

requirements is disturbing. Such inconsistencies pose undue confusion for qualified legal residents and undermine public confidence in the naturalization process.

The Commission believes the tests should be standardized and aim to evaluate a common core of information to be understood by all new citizens. The U.S. history and civics test should assess whether applicants understand the basic principles of U.S. government: for example, what it means to have freedom of speech or the freedom to assemble. The English test should accurately and fairly measure an immigrant's ability to speak, read, and write; the current practice of dictating English sentences for applicants to write is not an effective means of testing English proficiency.

INS is now undertaking a full review of its interview and testing criteria, including the content and format of the English and civics portions of the test. The Commission encourages officials responsible for naturalization to consult and enlist the assistance of professional educators, pedagogical experts, and standardized test providers in the development of new history/civics and English standards and tests. Consideration should be given to separating the English reading, writing, and comprehension components from the personal interview. Often, applicants are nervous about making a mistake during the interview and demonstrate less English proficiency than they may have. This separation also would work to the advantage of those responsible for adjudicating applications as interviews would be reserved for applicants who had fulfilled the English and civics requirements, sparing scheduling and interviewing of unqualified applicants.

The Arlington County, Virginia, Wilson Center provides education and training for immigrants using federal refugee program funds for language and employment services. It offers citizenship and English as a Second Language classes (focusing on child rearing and family violence). As the school registration center for foreign-born children, it can readily inform immi-grants of its services.

The American Telephone and Telegraph Company in India Hill, Illinois, learned the lengthy naturalization process was of major concern for its employees. It worked with the Chicago INS office to distribute naturalization applications and study guides to employees and provided space for officials to conduct interviews and naturalization ceremonies. A total of 400 employees and their family members became citizens.

These new standards will be meaningful only if applied equitably and there is a much greater capacity to monitor the agencies that give the tests. [See below.]

A more predictable and standardized testing process also must include consistent and rational exemptions for elderly legal permanent residents. At present English language exemptions are granted to legal permanent residents aged 50 years or older who have lived in the United States at least twenty years and to those 55 years of age who have resided in the U.S. for at least fifteen years. Special consideration on the civics component is given to naturalization applicants aged 65 or older who have resided in the U.S. for at least twenty years. The Commission supports these exemptions. However, it makes little sense to confer such exemptions on long-term legal residents, yet not on more recent elderly legal residents who have had less time to acquire English proficiency. The Commission calls for a thorough review of the current testing exemptions and urges the Congress to consider additional, narrowly-tailored exemptions to the English requirement for qualified elderly immigrants who have resided in the U.S. for fewer years than required by the current exemptions.

The Voter Education Registration and Action Program of the New England Literacy Resource Center in Boston, Massachusetts promotes adult literacy so that its students can take informed action on issues that concern them. The Center is supported by National Institute for Literacy grants under the 1991 National Literacy Act. In the November 1996 election, 467 out of 550 of the program's adult learners —85%— participated.

- **Expediting swearing-in ceremonies while maintaining their solemnity and dignity.** Approved applicants must take an oath of allegiance before U.S. citizenship is conferred upon them. Generally, the oath is administered in public ceremonies by federal judges. Most such ceremonies are solemn and dignified public affirmations of a mutual obligation that new Americans and their adopted country make to each other. However, in districts where the federal court has exercised sole jurisdiction to conduct the swearing-in cer-

emonies, long delays often result from crowded court calendars.

The Commission believes a more expeditious approach to the swearing-in ceremony should be adopted. Timely ceremonies need not sacrifice the ceremonial and traditional aspects of the ceremony that the Commission strongly believes are essential. The Commission believes the solemnity and pomp of the current judicial ceremonies should be maintained and could be enhanced by the inclusion of distinguished speakers. However, would-be citizens who have passed all requirements for naturalization should not be denied timely citizenship because of processing delays in scheduling swearing-in ceremonies.

Until 1990, the federal judiciary had sole jurisdiction to confer citizenship on an approved naturalization applicant. The Immigration Act of 1990, however, transferred authority to confer citizenship to the INS. Within one year, the Judicial Naturalization Amendments of 1991 reinstated the judiciary, albeit in a somewhat modified role. Consequently, judges who choose to exercise sole jurisdiction are granted forty-five days from notification of eligible applicants in which to perform swearing-in ceremonies. Despite the changes instituted by the 1991 Amendments, immigrants typically wait considerably longer to be sworn in as new citizens.

Such delays can have significant consequences for legal residents; they are unable to apply for particular jobs, travel abroad, vote, or receive certain benefits such as Food Stamps and Supplementary Security Income [SSI]. The Commission is concerned that as the number of newly-approved citizenship applicants increases, along with an increasing caseload

for the federal judiciary, the federal courts' capacity to perform timely ceremonies may be further hampered.

The Commission recommends that to reduce this waiting time Congress restore the Executive Branch's sole jurisdiction for naturalization. The Executive Branch should continue to work with federal judges as well as other qualified institutions and personnel, such as state courts or Immigration Judges, to ensure that swearing-in ceremonies are consistently conducted in a timely, efficient, and dignified manner. Eminent persons who would add dignity to the ceremony could be invited to participate as well. Standards of conduct should be developed for all such participants to assure, for example, that all remarks are free of partisan politics.

- **Revising the naturalization oath to make it comprehensible, solemn, and meaningful.** Taking the oath is a critical legal step in becoming a naturalized citizen. Its words convey the core meaning of becoming an American citizen. Thus, it is imperative that it be understandable by all who take it. We recommend that those naturalizing be given a written copy of the oath that they can read during the swearing-in and that they can keep as a meaningful memento. The current oath is not easy to comprehend. We believe it is not widely understood by new citizens. Its wording includes dated language, archaic form, and convoluted grammar. Although the 1952 statute does not prescribe any particular wording, it does require that the oath contain five elements: (1) support for the Constitution; (2) renunciation of prior allegiance; (3) defense of the Constitution against all

enemies, foreign and domestic; (4) true faith and allegiance; and (5) a commitment to bear arms or perform noncombatant service when required.

The Commission proposes the following revision of the oath as capturing the essence of naturalization.

> ***Solemnly, freely, and***
> ***without any mental reservation,***
> ***I,*** **[name]** ***hereby renounce under oath***
> ***[or upon affirmation]***
> ***all former political allegiances.***
> ***My sole political fidelity***
> ***and allegiance from this day forward***
> ***is to the United States of America.***
> ***I pledge to support and respect***
> ***its Constitution and laws.***
> ***Where and if lawfully required,***
> ***I further commit myself to defend them against all enemies, foreign and domestic, either by military or civilian service.***
> ***This I do solemnly swear [or affirm],***
> ***So help me God.***[4]

The Commission calls for urgently needed reforms to increase the efficiency and integrity of the naturalization process. The vast majority of applicants for naturalization are law-abiding immigrants who contribute to our society. The value of Americanization is eroded whenever unnecessary obstacles prevent eligible immigrants from becoming citizens. Its value also is undermined when the

The Commission calls for urgently needed reforms to increase the efficiency and integrity of the naturalization process.

[4] As is the case under current regulations, when applicants, by reason of religious training and belief or for other reasons of good conscience, cannot swear an oath, they may substitute "solemnly affirm" and delete "so help me God."

process permits the abuse of our laws by naturalizing applicants who are not entitled to citizenship. For the process of Americanization to succeed, it must provide fair and timely service to legal residents applying for citizenship. It must also earn the trust and confidence of the general public.

In August 1995, the INS launched an initiative to address many of the most serious impediments to naturalization, including a backlog in excess of 300,000 persons and processing times that in larger cities approached four years. Consequently, the Service hired more than 1,000 new personnel, opened several additional branch offices, and established direct mail centers.

While these new resources resulted in record numbers of naturalizations, improprieties in granting citizenship to criminal aliens and fraud in the testing process undermined the goals of the program. It is fair to conclude that the new program revealed many of the structural and managerial weaknesses of the overall naturalization process. Subsequent Congressional hearings and independent investigations demonstrate that many of the most serious problems preceded the new initiative and were exacerbated by the increasing number of applications.

The Department of Justice [DOJ] has launched a variety of new initiatives to reengineer naturalization. DOJ named a Director for Naturalization Operations charged with overseeing management and reform of the naturalization program, including quality assurance and field operations. DOJ also contracted with Coopers and Lybrand to conduct a two-year review of the implementation and administration of the INS naturalization program.

Recognizing steps already are underway to reengineer the naturalization process, the Commission supports the following approaches:

- **Instituting efficiencies without sacrificing quality controls.** In the Commission's 1995 report to Congress, we recommended that the Immigration and Naturalization Service and the Congress take steps to expedite the processing of naturalization applications while maintaining rigorous standards. Two years later, the naturalization process still takes too long, and previous efforts to expedite processing resulted in serious violation of the integrity of the system.

  Because of failures in processing that resulted in the naturalization of ineligible applicants, new procedures subsequently were adopted to reduce inadvertent naturalization of criminal aliens. These new procedures, while not foolproof in barring criminals from naturalizing, have led to processing delays. At the same time, adequate staffing remains a problem. Congress has authorized reprogramming of funds to hire additional staff, but the Committees permitted temporary hires for most of the new positions even though the number of applications remain large. An entirely temporary workforce with short contracts lends instability to a process that already has problems. Instituting a system that has sufficient continuity of personnel and that is both credible and efficient therefore remains a pressing need.

- **Improving the integrity and processing of fingerprints.** Before applicants for naturalization can receive citizenship, they must submit fingerprints for FBI review to determine if the applicants have any disqualifying criminal background. Problems that delay thousands of applications have been identified in the operation of private agencies taking the fingerprints of applicants for citizenship. These problems include smudged prints and failure of applicants to sign or properly complete forms. Further, no mechanism now ex-

ists to verify accurately that the individual submitting the prints is the person whose prints are on the application.

To improve this process, the INS placed restrictions on who may qualify to offer fingerprint services. INS now accepts only fingerprints provided by Designated Fingerprint Services [DFS] trained and authorized by INS. These include local law enforcement agencies, nonprofit agencies, and fingerprint convenience stores. These restrictions may improve the quality of the prints, but do nothing to ensure that fingerprint services consistently and competently verify the identity of individuals whose prints are submitted. While law enforcement agencies have a vested interest in preserving the quality of fingerprints, they have heavy workloads and do not always give high priority to naturalization requests. Nonprofit, community-based organizations appear to take clear fingerprints, but there are questions about their competence to assess the validity of identity documents.

The Commission believes than only service providers under direct control of the federal government should be authorized to take fingerprints. If the federal government does not take fingerprints itself but instead contracts with service providers, it must screen and monitor such providers rigorously for their capacity, capability, and integrity. Failure to meet standards would result in termination of the contract.

- **Contracting with a single English and civics testing service.** The Commission urges a fundamental restructuring of the policies and procedures with which private agencies test naturalization applicants for their knowledge of English and civics.

A 1991 regulation authorized the INS to recognize the results of private for-profit and nonprofit testing services. The rationale was that private testing of civics and English would help to adjudicate citizenship applicants more expeditiously. By 1994, six organizations had been authorized by the INS to administer the citizenship exam.

Congressional hearings during the fall of 1996 revealed disturbing weaknesses in the use of private testers that undermined the integrity of the citizenship test. In response to reports that private, for-profit testing services were engaging in price gouging, cheating, and fraud, INS investigated three sites. In April and May of 1996, INS made some changes to improve testing site oversight Local INS offices were directed to conduct unannounced inspections of citizenship-testing affiliate locations if the office did not already have an inspection plan in place. The congressional hearings revealed that private testers continued to be inadequately supervised or disciplined by either INS or their parent company.

The Commission recommends that the federal government contract with one national and respected testing service to develop and give the English and civics tests to naturalization applicants. Having one organization under contract should help the government substantially improve its oversight. Moreover, continuity with a highly-respected and nationally-recognized testing service will help ensure a high quality product.

- **Increasing professionalism**. While many naturalization staff are highly professional in carrying out their duties, reports

from district offices, congressional hearings, and complaints from naturalization applicants demonstrate continued dissatisfaction with the quality of naturalization services. The Commission believes that a culture of customer-oriented service must be developed.

Recent audits point to very high levels of noncompliance with established practices and excessive error rates even in such basic tasks as filling in the proper names and identifying numbers on forms. Mistakes pose two serious problems for the naturalization process. First, legitimate applicants for naturalization face unnecessary delays while clerical and other mistakes are corrected. Second, ineligible applicants, including felons, may be able to obtain citizenship through administrative error. While INS must pursue denaturalization of such improperly naturalized citizens vigorously within legal limits, it is difficult to reverse grants of citizenship once made. Recruitment and training of longer-term staff assigned to adjudicating applications and overseeing quality control would help overcome some of these problems.

- **Improving automation.** According to the INS, the number of naturalization applicants projected for fiscal year 1997 and each of the following few years will exceed 1.8 million. As more and more immigrants apply for naturalization and choose to become part of the American polity, there is a greater need for efficient and accurate recordkeeping. Current systems are inadequate to meet such a demand for service. Both the INS and FBI rely on paper rather than electronic files, which is inefficient and subject to permanent loss or misplacement of documents. The inability of INS to provide accurate data on the number of recently-naturalized citizens who had undergone full background investigations is a particularly glaring example of the present system's

vulnerabilities. The costs to applicants and to INS credibility are significant. The Commission is encouraged by plans to develop linkages among data sources related to naturalization. The Commission recommends continued funding for an up-to-date, advanced, electronic automation system for information entry and recordkeeping.

- **Establishing clear fee and other waiver guidelines and implementing them consistently.** Under current law, the Attorney General is authorized to grant fee waivers to naturalization applicants. The Commission has received accounts of legitimate requests being denied. The prospective increase in naturalization fees may precipitate more fee waiver requests or perhaps discourage applicants. Clear guidelines and consistent implementation are needed to ensure that *bona fide* requests are granted, while guarding against abuse.

  The 1994 Immigration and Nationality Technical Corrections Act provided exceptions to the English proficiency and civics requirements for naturalization for persons with physical or developmental disabilities or with mental impairments. After extensive consideration and opportunities for public comment, the INS published its final rule in March 1997.

  The new rule emphasizes medically determinable standards that promote integrity and fairness. Further, the new rule does not confer a blanket exemption. Hence, judging whether an applicant's disability would bestow a disability waiver is inherently complex.

  The Commission believes that rigorous and equitable interpretation of the new rule will require that adjudicators are properly trained. Further, implementation must be strictly monitored to ensure that exceptions allowed by law are made

available to otherwise qualified legal residents. Finally, to ensure that the qualifications and procedures are understood and adhered to, the Commission recommends a thorough public education effort.

A CREDIBLE FRAMEWORK FOR IMMIGRATION POLICY

In our previous reports, the Commission defined a credible immigration policy "by a simple yardstick: people who should get in do get in, people who should not get in are kept out; and people who are judged deportable are required to leave." By these measures, the U.S. has made substantial, but incomplete, progress. What follows are the Commission's recommendations for comprehensive reform to achieve more fully a credible framework for immigration policy.

LEGAL PERMANENT ADMISSIONS

The Commission reiterates its support for a properly-regulated ***system for admitting legal permanent residents.***[1] Research and analyses conducted since the issuance of the Commission's report on legal immigration support our view that a properly regulated system of legal permanent admissions serves the national interest. We reiterate that such a system enhances the national benefits while protecting against potential harms.

The Commission reiterates its support for a properly-regulated system for admitting legal permanent residents.

This position is supported by a recent report we commissioned from the National Research Council on the impacts of immigration.[2] The panel concluded that "immigration produces net economic gains for domestic residents" in the form of increased productivity and reduced consumer prices. The benefits go well beyond economic ones, however. The panel also identified social and cultural gains

---

[1] For a full explanation of the Commission's recommendations see *Legal Immigration: Setting Priorities,* 1995. See Appendix for summary of Commissioner Leiden's dissenting statement.

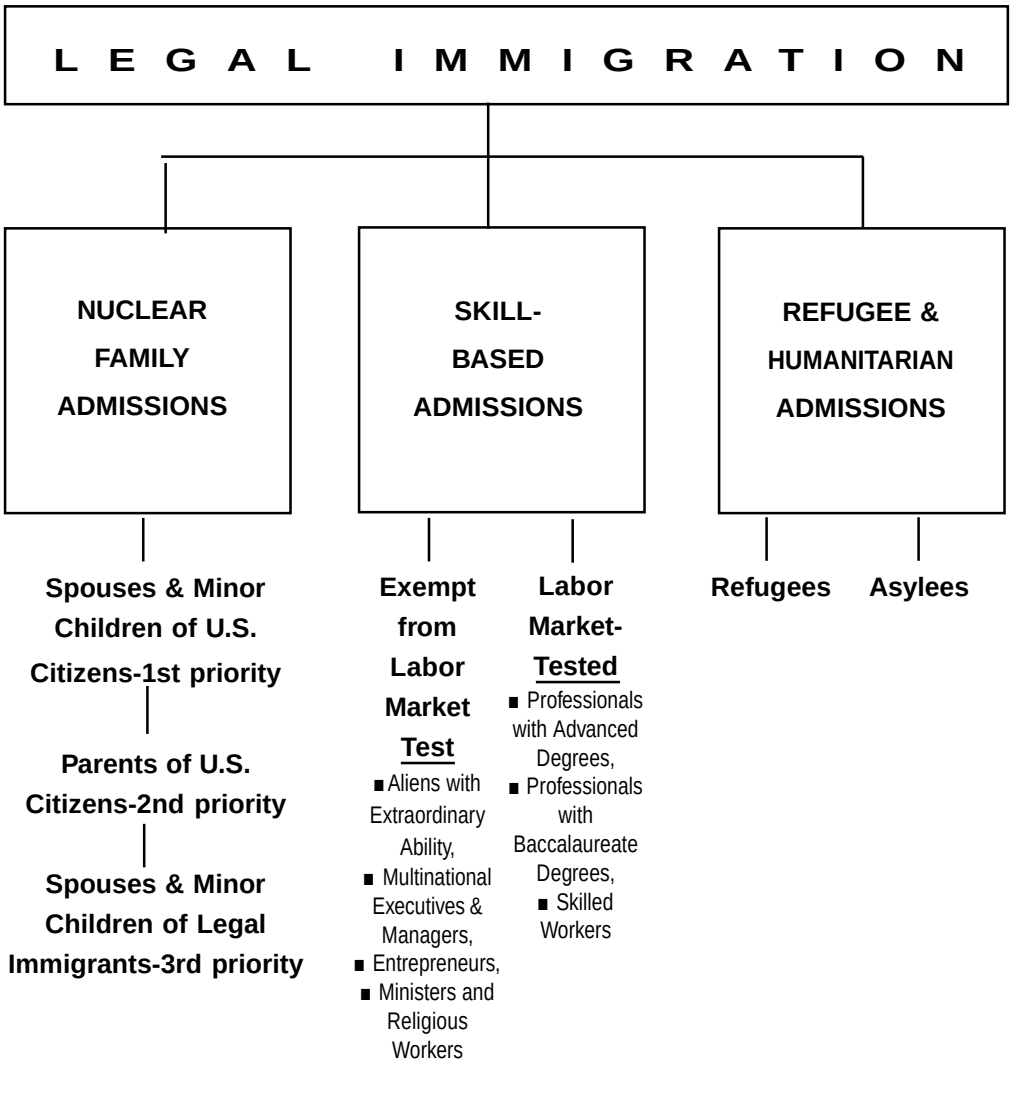
[2] National Research Council. (J.P. Smith, B. Edmonston, eds.). 1997. *The New Americans: Economic, Demographic, and Fiscal Effects of Immigration.* Washington, DC: National Academy Press. 62.

resulting from immigration, particularly through the entry of highly-talented immigrants who choose to live and contribute to the United States. The report continues: "Even when the economy as a whole gains, however, there may be losers as well as gainers among different groups of U.S. residents." The principal "gainers" are the immigrants themselves, owners of capital, higher-skilled workers who are complements to most immigrants (who are themselves lower-skilled) and consumers. The principal "losers" are the low-skilled workers who compete with immigrants and whose wages fall as a result. On a fiscal basis, the panel found national-level net contributions of tax revenues resulting from immigration, but the panel also identified significant net fiscal costs to the taxpayers of states with large number of immigrants. These high fiscal impacts are due, particularly, to the presence of sizeable numbers of lesser-skilled immigrants whose tax payments, even over a lifetime, are insufficient to cover their use of services.

The Commission urges reforms in our legal immigration system to enhance the benefits accruing from the entry of newcomers while guarding against harms, particularly to the most vulnerable of U.S. residents—those who are themselves unskilled and living in poverty. More specifically, the Commission reiterates its support for:

- **A significant redefinition of priorities and reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration policy.** The Commission's more specific recommendations on priorities and procedures for admission stem not only from the above analysis of the effects of immigration but also from our review of the workings of the admission system. We argued in our 1995 report that the current framework for legal immigration—family, skills, and humanitarian admissions—makes sense. However, the statutory and regulatory priorities and procedures for admissions do not support the stated intentions of legal

Proposed Tripartite Immigration System



immigration—to reunify families, to provide employers an opportunity to recruit foreign workers to meet labor needs, and to respond to humanitarian crises around the world. During the two years since our report on legal immigration, the problems in the legal admission system have not been solved. Indeed, some of them have worsened as is discussed below.

We believe current immigration levels should be sustained for the next several years while the U.S. revamps its legal immigration system and shifts the priorities for admissions away from extended family and toward nuclear family and away from unskilled and toward higher skilled immigrants. Thereafter, modest reductions in levels of immigration—to about 550,000 per year, comparable to those of the 1980s—will result from the changing priority system.

The Commission continues to believe that legal admission numbers should be authorized by Congress for a specified time (e.g., three to five years) to ensure regular, periodic review and, if needed, change by Congress. This review should consider the adequacy of admission numbers for accomplishing priorities. It also should consider the economic and other domestic needs and capacities of the United States to absorb newcomers.

- **Family-based admissions that give priority to nuclear family members—spouses and minor children of U.S. citizens, parents of U.S. citizens, and spouses and minor children of legal permanent residents—and include a backlog clearance program to permit the most expeditious entry of the spouses and minor children of LPRs.**

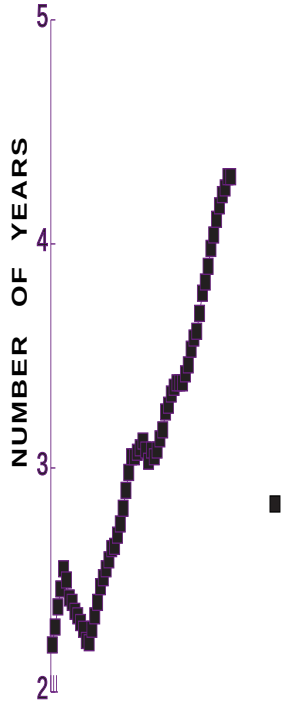
The Commission recommends allocation of 550,000 family-based admission numbers each year until the large backlog

of spouses and minor children is cleared. The backlog, which numbers more than 1 million persons, consists of the nuclear family members of legal immigrants who married after the U.S. spouse became a permanent resident, as well as spouses and minor children of aliens legalized under IRCA (most of whom are now eligible to naturalize). Numbers going to lower priority categories (e.g., adult children, siblings, and diversity immigrants), should be transferred to the nuclear family categories. Thereafter Congress should set sufficient admission numbers to permit all spouses and minor children of citizens and LPRs to enter expeditiously.

Since the Commission first reported its findings on legal admissions, the problems associated with family-based admissions have grown. In 1995, the wait between application and admission of the spouses and minor children of LPRs was about three years. It is now more than four years and still growing.[3]

Various statutory changes enacted in 1996 make it all the more important that Congress take specific action to clear the backlog quickly to regularize the status of the spouses and minor children of legal permanent residents in the United States. In an effort to deter illegal migration, Congress expanded the bases and number of grounds upon which persons may be denied legal status because of a previous illegal entry or overstay of a visa. Most important, a person un-

Waiting Time for Spouses and Minor Children of LPRs (FB-2A)



Source: DOS Visa Office
Visa Bulletin (1992-1997).

[3] It appears that the priority date (i.e., the cut-off date by which an approved petition must have been filed) has moved forward as much as it has only because of delays in processing applications for adjustment of status within the United States. When it became clear that INS could not keep up with the adjustment backlog, the Department of State moved up the priority date to continue processing visas overseas. As many of the adjustment applications are still to be processed, it is likely that there will be very little movement on the priority date during the next several months.

lawfully present for more than six months will be inadmissible for three years, and those unlawfully present for more than one year will be inadmissible for ten years.[4] If Congress decides not to renew the provision [known as Section 245(i)] that permits these individuals to adjust status within the United States, they will be unable to become legal immigrants even if they meet all other admission criteria.

An unknown, but believed to be large, number of spouses and minor children awaiting legal status are unlawfully present in the United States. While the Commission does not condone their illegal presence, we are cognizant of the great difficulties posed by the four-or-more-year waiting period for a family second-preference visa. U.S. immigration policy should not force legal immigrants to choose between family responsibilities and vows and their continued presence in the United States. The Commission believes no spouse or minor child should have to wait more than one year to be reunited with their U.S. petitioner.

The Commission is also concerned with the impact on nuclear family reunification of the provisions adopted in the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 [IIRIRA] to address perceived abuses in the use of parole. We agree that parole should be used only in exceptional circumstances and that Congress should be involved more directly in decisions to parole large numbers of individuals for permanent residence. We further recognize the validity of efforts to count long-term parolees against worldwide numerical ceilings. However, we do not agree with

[4] IIRIRA permits the Attorney General to provide a waiver for spouses and minor children if there is an extreme hardship to the U.S. petitioner. Although standards have not been set for implementing this provision, mere separation from family members generally has not counted as an "extreme hardship" in applying other provisions where extreme hardship is a ground for relief.

the IIRIRA provisions that count parolees against family-based admission numbers. Moreover, the language of IIRIRA requires the counting of those admitted with the intention that they reside permanently *and* those who are paroled for short stays but who are not known to have left one year later. For the first time in U.S. law, persons illegally in the U.S. would be counted against legal admission ceilings. This creates a conflict between policies. Moreover, inadequacies in current entry-exit controls mean that some parolees who leave the country will be determined to have remained and will also be counted against the legal admissions ceiling. Because the parole numbers are deducted from the family preferences, the new provisions hold the potential for delaying still further the already unacceptable delays in admission of nuclear family members.

The Commission believes that the national interest in the entry of nuclear family members outweighs that of more extended family members. We recognize that others disagree; they argue that the bonds to adult children and adult siblings can be as strong as the bond between spouses and with minor children. They also point to the valuable assistance provided by many extended families in setting up and running businesses and providing child care and other supportive services. Whatever the cultural and economic values attached to each family relationship, however, the far stronger responsibilities to one's spouse and minor children are well established in the U.S. We continue to believe that our family reunification system will remain seriously flawed until the spouses and minor children of LPRs are treated as a priority.

An end to extended visa categories is justified even apart from the large nuclear family backlog. The Commission pointed out in its 1995 report that the extraordinarily large

waiting list for siblings of U.S. citizens, and to a lesser extent, adult children undermines the integrity of the legal immigration system.

The backlog for siblings of adult U.S. citizens has stabilized during the past two years, but at a very large level. In January, 1995, there were 1.6 million on the waiting list; as of January 1997, the waiting list was 1.5 million. Except for oversubscribed countries, siblings who applied ten years ago are now eligible to enter. Admissions from the Philippines are of those who applied almost twenty years ago. These extended waiting periods mean that most siblings enter well into their working lives, limiting the time during which they can make a contribution to the U.S. economy. More than one-half of all the siblings and their spouses admitted in FY 1996 were above the age of 45. In other immigration categories, most principals are in their twenties or thirties.

The backlog for adult children is growing. In January 1995, there were about 70,000 unmarried sons and daughters of citizens, 500,000 unmarried sons and daughters of LPRs, and 260,000 married sons and daughters of citizens in the backlog. As of January 1997, the unmarried backlog had grown to more than 90,000 and 575,000, respectively, and the married children backlog is more than 310,000.

A particular concern is the "aging out" of children who were minors at the time of application, but who turned 21 years of age while awaiting their green cards. The Commission proposed in our 1995 report that the Immigration and Nationality Act [INA] be amended so that "a person entitled to status at the time a petition is approved shall continue to be entitled to that status regardless of his or her age."

- **Skill-based admissions policies that enhance opportunities for the entry of highly-skilled immigrants, particularly those with advanced degrees, and eliminate the category for admission of unskilled workers.** The Commission continues to recommend that immigrants be chosen on the basis of the skills they contribute to the U.S. economy. Only if there is a compelling national interest—such as nuclear family reunification or humanitarian admissions—should immigrants be admitted without regard to the economic contributions they can make. The reunification of adult children and siblings of adult citizens solely because of family relationship is not as compelling.

  A number of the NRC report's findings argue for increasing the proportion of immigrants who are highly-skilled and educated so as to maximize fiscal contributions, minimize fiscal impacts, and protect the economic opportunities of unskilled U.S. workers. The NRC research shows that education plays a major role in determining the impacts of immigration. Immigration of unskilled immigrants comes at a cost to unskilled U.S. workers, particularly established immigrants for whom new immigrants are economic substitutes. Further, the difference in estimated fiscal effects of immigrants by education is striking: using the same methodology to estimate net costs and benefits, immigrants with a high school education or more are likely to be net contributors while those without a high school degree are likely to be net costs to taxpayers.

  Shifting priorities to higher skilled employment-based immigrants will have a beneficial multiplier effect. The highly-skilled are, in effect, new seed immigrants who will petition for admission of their family members. The educational

level of the spouses and children of highly-educated persons tends to be in the same range. Hence, our society benefits not only from the entry of highly-skilled immigrants themselves, but also from the entry of their family.

The Commission's framework for legal skill-based admissions includes two broad categories. The first category would cover individuals who are exempt from labor market tests because their entry will generate economic growth and/or significantly enhance U.S. intellectual and cultural strength without undermining the employment prospects and remuneration of U.S. workers: aliens with extraordinary ability, multinational executives and managers, entrepreneurs, and ministers and religious workers. The second category covers individuals subject to labor market tests, including professionals with advanced degrees, professionals with baccalaureate degrees, and skilled workers with specialized work experience.

In our 1995 report, the Commission recommended allocation of 100,000 admission slots to skill-based immigrants. That number represented an increase of about 10 percent over actual usage of these visas, but a decline from the statutory ceiling of 130,000 admission numbers (i.e., 140,000 minus the 10,000 allocated to lesser skilled workers). We further recommended that unused skill-based admissions carry over to the following year's skill-based admissions.

The trend in admission of skill-based immigrants supports our 1995 recommendations, but also indicates the great need to monitor and revise admission numbers as needed. In FY 1995, 85,000 employment-based immigrants were admitted, including 7,900 unskilled workers. This number was artificially low, however, because of INS delays in adjudicating

applications for adjustment of status. In FY 1996, admissions totaled 117,000, including 12,000 unskilled workers. The 100,000 skilled admission numbers recommended by the Commission would have been sufficient to cover the period 1994-1996 (with the carry-over provision). However, if the FY 1996 spike turns out to be real (rather than an artifact of the adjustment of status delays of FY 1995), the number of employment-based visas may need to be revised.

The Commission also continues to recommend changes in the procedures used in testing the labor market impact of employment-based admissions. Rather than use the lengthy, costly, and ineffectual labor certification system, the Commission recommends using market forces as a labor market test. To ensure a level playing field for U.S. workers, employers would attest to having used normal company recruiting procedures that meet industry-wide standards, paying the prevailing wage, and complying with other labor standards. Businesses recruiting foreign workers also would be required to make significant financial investments in certified private sector initiatives dedicated to improving the competitiveness of U.S. workers. These payments should be set at a per-worker amount sufficient to ensure there is no financial incentive to hire a foreign worker over a qualified U.S. worker. Labor certification continues to be a time-consuming, unproductive way to protect U.S. workers from unfair competition from immigrant workers. The Department of Labor has tried to institute reforms that have streamlined the process for certain applications. The result, however, has been to slow down even further other applications that do not meet the streamlining requirements.

- **Refugee admissions based on human rights and humanitarian considerations, as one of several elements of** U.S.

leadership in assisting and protecting the world's **persecuted.**[5] Since its very beginnings, the United States has been a place of refuge. Today, when millions of refugees are displaced because of persecution, human rights violations, or warfare, U.S. leadership in responding to refugee crises is critical. The Commission believes continued admission of refugees sustains our humanitarian commitment to provide safety to the persecuted, enables the U.S. to pursue foreign policy interests in promoting human rights, and encourages international efforts to resettle persons requiring rescue or durable solutions. The Commission also urges the federal government to continue to support international assistance and protection for the majority of the world's refugees for whom resettlement is neither appropriate nor practical.

Admissions to the U.S. should be seen within the context of broader U.S. interests in protecting and assisting refugees worldwide. The Commission believes a comprehensive U.S. refugee policy should be coordinated by an office within the National Security Council [NSC] to serve as the White House focal point for domestic and international refugee and related humanitarian issues: to care for and protect refugees overseas; to resettle the few for whom U.S. resettlement is the only or best option and provide sensible transitional assistance to them; to operate an effective system for protecting *bona fide* asylum seekers in the U.S. while deterring those who are not; and to adopt a humane and effective plan to respond to mass migration emergencies.

The admission of refugees should be divided into two broad priority groups with numbers allocated accordingly. The first priority would be for refugees who are in urgent need

[5] For a full explanation of the Commission's refugee-related recommendations, see *U.S. Refugee Policy: Taking Leadership,* 1997.

of rescue and refugees who are the immediate relatives of persons already living legally in the United States. The second priority would include refugees whose admission is of special humanitarian interest to the United States but who are not in imminent danger where they currently reside. Admission numbers would be sufficient each year to guarantee entry to all *bona fide* applicants within the first priority and an agreed-upon number for the second priority Family members and close household members who are dependent on the principal applicant for financial or physical security should also be included among admissions within this priority system.

The United States should set annual numerical targets—but not a statutory limit—for future refugee admissions. The Commission recommends an improved consultation process that will help ensure that admission numbers and allocations meet U.S. national and international interests. The annual consultations should be strengthened by considering projections of admission levels and priorities for at least two years beyond the fiscal year under immediate consideration. Input should be solicited from a wide range of human rights and humanitarian organizations with knowledge of conditions precipitating the need for resettlement.

The United States also should use an active, inclusive process for identifying and making decisions regarding the admissibility of applicants for resettlement, conferring with a broad set of agencies in identifying possible candidates for resettlement. The U.S. government should confer with a broader set of agencies in identifying possible candidates for resettlement, including international and local human rights organizations, relief agencies providing assistance to refugees, and host governments.

The Commission further believes changes are needed to make the administrative processes for admission more flexible and streamlined in determinations of eligibility in order to respond quickly to refugee crises. Also, refugees should be admitted with LPR status except in cases where there has been inadequate opportunity prior to admission for the admitting officer to thoroughly review the case(s).

The Commission supports a continuing program of assistance to refugees after entry. The current array of assistance and services that characterize the resettlement program should be maintained, but with increased attention to services that prepare refugees for rapid economic self-sufficiency and civic participation. In addition, the federal, state, and local agencies involved in resettlement should develop a national plan for streamlining the program to address the complexity of the funding process and reporting requirements, the overlap of programs and responsibilities, and the lack of clear accountability for the outcomes of the program.

The current public/private partnership in the domestic resettlement program should be continued, but for a three-year trial period their division of responsibility should be more explicit, with (1) the public sector assuming responsibility for refugees eligible for the publicly funded public assistance programs and (2) the private sector being responsible for a limited duration program for refugees not eligible for the mainstream public programs.

The mechanisms by which the refugee program is funded should be strengthened through changes to the Refugee Act: (1) to specify a minimum time period of special refugee cash and medical assistance provided to refugees not eligible for Temporary Assistance for Needy Families [TANF] or Supplemental Security Income [SSI]; (2) to permit the appropria-

tion of "no year" money for the cash and medical assistance portion of the Office of Refugee Resettlement [ORR] budget; (3) to broaden the consultation process to ensure greater consistency between admission decisions and appropriation of funds to support refugee assistance and services; and (4) to establish a domestic emergency fund.

The Commission continues to recommend against denying benefits to legal immigrants solely because they are noncitizens. The Commission believes that the denial of safety net programs to immigrants solely because they are noncitizens is not in the national interest. In previous reports, the Commission argued that Congress should address the most significant uses of public benefit programs —particularly, elderly immigrants using Supplementary Security Income—by requiring sponsors to assume full financial responsibility for newly-arriving immigrants who otherwise would be excluded on public charge grounds. In particular, the Commission argued that sponsors of parents who would likely become public charges assume the responsibility for the lifetimes of the immigrants (or until they became eligible for Social Security on the basis of work quarters). We also argued that sponsors of spouses and children should assume responsibility for the duration of the familial relationship or a time-specified period. We continue to believe that this targeted approach makes greater sense than a blanket denial of eligibility for public services solely on the basis of a person's alienage.

The Commission continues to recommend against denying benefits to legal immigrants solely because they are noncitizens.

Basing eligibility for assistance on citizenship debases citizenship. We encourage immigrants to become citizens in order to participate fully in the civic life of the country. We do not want immigrants to become citizens solely because the alternative is the serious economic hardship that may result if benefits are lost or unavailable. In some cases, categorical denial of eligibility to legal aliens undermines the very purpose of our immigration policy. For example, the United States admits refugees, as noted above, to provide protection against the dangerous situations they encounter in their home coun-

tries and first-asylum countries. Some of the most vulnerable refugees requiring such protection are the elderly and disabled who will have the greatest difficulty meeting our naturalization standards.

This is not to deny that elderly and disabled immigrants pose a cost to U.S. taxpayers. The NRC report confirms this fact. By contrast, however, immigrants who come during their prime working years generally do not pose a net cost to the taxpayer over their lifetime. Most of the fiscal impact related to the presence of immigrants comes in the area of education, which can be seen as both a cost and an investment as education has long-term benefits to the United States both in a more skilled workforce and in higher income and resulting tax payments.

The Congress did not accept the Commission's recommendations to preserve the safety net. Some eligibility for elderly and disabled immigrants receiving Supplementary Security Income lost as of the enactment of the welfare reform legislation has been restored as a result of budget negotiations. Eligibility for food stamps and other programs designed for the working poor were not restored, however. And, future immigrants will be ineligible for SSI even if they become disabled after entry and have no other means of support.

The Congress did adopt, but in a modified version, the Commission's recommendation for binding affidavits of support. The 1996 legislation framed the requirement in two ways that differ from the Commission's recommendations. First, the legally-binding affidavit, with its more rigorous requirements regarding the income of sponsors, applies to some persons who are not likely to be public charges but not to others who are likely to require assistance. The affidavits apply to *all* family-based immigrants, not just to those who are likely to be public charges. By contrast, the new affidavit will not be used for other admission categories (for example, diversity immigrants) even if an immigrant is likely to be a public charge.

Second, under the new legislation, the same time periods and requirements apply to everyone who signs an affidavit. The affidavits are in force until the immigrant works forty quarters or becomes a U.S. citizen. The Commission believes the period of responsibility should be geared instead to the family relationship and likely period during which the immigrant may require assistance. For example, the sponsors of an elderly parent would be required to assume a longer (even an indefinite) period of support if the parent is of an age that makes it unlikely that he or she would become self-supporting. The responsibility for a spouse, however, would be for a time-limited period or for the duration of the marriage, whichever is longer. Under the new law, the responsibility of petitioners of younger immigrants is so open-ended that it does not provide a realistic or fair set of obligations. For example, if a U.S. citizen marries a foreign student with a professional degree and a job offer, the U.S. citizen must now take on a open-ended obligation to the foreign student, an obligation that carries on even if the marriage ends in divorce. If the immigrant spouse chooses not to work (and therefore doesn't meet the forty quarters requirement) and not to naturalize, the citizen remains responsible for his or her financial support (at 125 percent of the poverty level) indefinitely. The law has no "good cause" exception.

To conclude, the Commission's recommendations on legal admissions are as relevant today as they were in 1995. The Commission urges the Congress to take the measures needed to reform our legal immigration policies so it best serves the national interest in a well-regulated immigration system.

LIMITED DURATION ADMISSIONS

Persons come to the United States for limited duration stays for several principal purposes: representation of a foreign government or other foreign entities; work; study; and short-term visits for commercial or personal purposes, such as tourism or family visits. These individuals are statutorily referred to as "nonimmigrants." In this report, however, we refer to "limited duration admissions [LDAs]", a term that better captures the nature of their admission. When the original admission expires, the alien must either leave the country or meet the criteria for a new LDA or permanent residence. The term "nonimmigrants" is misleading as some LDAs entering the United States are really in transition to permanent residence, and other LDAs enter for temporary stays and become permanent residents based on marriage or skills.[6]

The benefits of a well-regulated system of LDAs are palpable. LDAs represent a considerable boon to the U.S. economy. The tourism and travel industry (domestic and international) is the second largest employer in the United States and generates 6 percent of the nation's Gross Domestic Product [GDP]. International tourism provides a net trade surplus (dollars international visitors spend here minus dollars U.S. visitors spend outside the U.S.) of $18 billion. Worldwide, the U.S. earned the most from international visitors—more than $64 billion.

Foreign students and workers often enrich the cultural, social, and scientific life of the United States. Our universities gain access to many talented students worldwide, thus maintaining the global competitiveness of the U.S. system of higher education. Foreign students give U.S. students the opportunity to learn about foreign

---

societies and cultures and, on returning home—often to positions of leadership—share their exposure to our democratic values, constitutional principles, and economic system. Foreign workers give employers timely access to a global labor market when they cannot identify or quickly train U.S. workers with knowledge and expertise required for a specific job. These worker programs also help companies conducting business both in the U.S. and internationally to reassign personnel as needed to maintain their competitiveness. As economies become increasingly integrated, companies are attracting more and more U.S. workers abroad as well.

Yet, LDAs pose problems for U.S. society under two principal circumstances: when the aliens fail to depart at the end of their legal stay; and when they present unfair competition to U.S. workers. The first problem is an enforcement one. Although overstayers represent a minute portion of the LDAs admitted each year, they are a significant part of the illegal immigration problem. The Immigration and Naturalization Service estimates that as many as 40 percent of the illegal aliens currently in the country originally entered with LDAs, many as short-term visitors. An equally pressing problem is the current inability to track the continued presence and whereabouts of many longer-term LDAs, particularly foreign students, after their arrival in the United States. This lack of capacity to monitor their presence exacerbates the problems of overstay and other violations of their legal status.

The second issue arising in limited duration admissions relates to the criteria for admission of foreign workers and the procedures used to determine their impact on U.S. workers. A proper balance must be struck in the LDA system between enhancing the productivity and global competitiveness of the U.S. economy through access to foreign workers and protecting U.S. workers against unfair competition.

The availability of foreign workers may create a dependency on

them. It has been well-documented that reliance on foreign workers in low-wage, low-skill occupations, such as farm work, creates disincentives for employers to improve pay and working conditions for American workers. When employers fail to recruit domestically or to pay wages that meet industry-wide standards, the resulting dependence—even on professionals—may adversely affect both U.S. workers in that occupation and U.S. companies that adhere to appropriate labor standards. For many of the foreign workers, even wages and working conditions that are very poor by U.S. standards are much better than those available at home. In a few egregious cases, businesses have hired temporary foreign workers after laying off their own domestic workforce.

The Immigration Act of 1990 imposed numerical limits on two employment categories where such dependence was feared: H-1B (specialty workers) is capped at 65,000 per year, and H-2B (unskilled workers) is capped at 66,000 per year. While the H-2B category is far from its numerical limits, the statutory cap on annual H-1B admissions was reached for the first time in FY 1997. INS announced in August 1997 the formation of a waiting list because approved workers would be ineligible to enter until the start of the next fiscal year. If the trend in applications continues, the cap is likely to be reached even earlier in FY 1998. Hence, employers petitioning late in the year would be required to wait for the admission of approved workers.

The current business users of the H-1B tend to fall into two distinct categories. One group of employers is clearly unlikely to become dependent on foreign workers but potentially is adversely affected by the numerical limits. These employers tend to hire relatively few foreign workers (for example, measured as a proportion of their overall workforce). Generally, they have identified specific foreign workers whose specialized skills are needed. Often, the company has done extensive recruitment in the United States and has been unable to find qualified workers with the specific skills they seek.

Because foreign workers represent a relatively small proportion of their workforce, there is little risk that foreign hires will cause either job displacement or wage depression for U.S. workers.

A second group of employers includes companies that make extensive use of H-1B professionals (again, as measured by proportion of their workforce). Sometimes, they seek approval in the same application for a large number of foreign workers who share minimal professional qualifications. But even within this more dependent group, there is variation in the risk posed by the importation of foreign workers to U.S. workers. Some employers recruit domestically or take other steps to employ U.S. workers, but they are unable to find sufficient professionals to fill their needs. Other employers recruit exclusively overseas and make no effort to employ qualified U.S. workers. They may utilize the H-1B workers in their own operations or contract the foreign workers to other employers.

Under current law, the numerical limits, and now required waiting time, pertain equally to the employer who has few foreign workers and the employer who has only foreign workers. Similarly, the same provisions apply to the employer who has recruited extensively within the United States and been unable to find a worker with the needed specialized skills and to the employer who does no domestic
recruitment.

The recommendations presented in this report seek to maximize the potential benefits for the U.S. economy and society resulting from the admission of LDAs while minimizing the potential negative effects. They build on—and in some cases reinforce—the Commission's previous recommendations for reforming the permanent legal immigration system. The overarching goal is to maintain the advantages that accrue to American society from entry of LDAs while protecting the legitimate interests of American workers and businesses from unfair competition.

Principles for a Properly-Regulated System

The Commission believes that LDA policy should rest on the following principles:

- **Clear goals and priorities**. LDA policy should clearly differentiate the goals of each set of visa categories, with procedures that reflect the requirements of each type of visa and subsequent admission. With more than forty different LDA visas provided for under current law, as discussed below, it is often difficult to identify how the goals of one category differ from those of others.

- **Systematic and comprehensible organization of LDA categories**. The statutory definitions, criteria, and procedures for visas and admission have developed in an *ad hoc* fashion. There is now accumulation of more than forty different LDA visas (subsumed under nineteen alphabetical headings), including overlapping categories for students, workers, and other visitors, as well as additional visas added to address the concerns of specific interest groups. Simplification of the system would enable businesses, educators, persons with LDAs, government officials, and the general public to understand more clearly the requirements for visa application and admission and the responsibilities of the persons with LDAs and their sponsors. Administration of the LDA system could be simplified, with attendant reduction in cost and confusion.

- **Timeliness, efficiency, and flexibility in implementation**. LDA policy should be implemented in a timely and efficient way with sufficient flexibility in law and regulations to respond to such domestic considerations as changes in the economy and our educational systems. Because of the time-limited nature of the stay, it is imperative that the system

allow admissions decisions to be made expeditiously while retaining a capacity to identify unqualified or fraudulent applications. Similarly, the provisions to protect U.S. workers must allow for timely and efficient mechanisms to investigate complaints and impose appropriate sanctions. While a good part of the LDA system now functions in a timely way, the diffusion of responsibility in foreign worker categories reduces the potential efficiency of that part of the system. The Commission's structural reform recommendations, discussed below, will help address certain inefficiencies.

- **Compliance with conditions for entry and exit and effective mechanisms to monitor and enforce this compliance.** The LDA system should be designed to allow for greater compliance, monitoring, and enforcement. Policies should specify clearly the conditions of entry and the penalties for noncompliance. It is the responsibility of the government, with the cooperation of the private sector where appropriate, to record, track, and report on those entering for limited duration stays. Americans expect that aliens will respect and observe the conditions of their temporary admission, including departure at the end of their lawful stay, and that they will be subject to government enforcement if they fail to comply with the conditions of their admission or if they overstay. Their sponsors (generally, businesses and schools) also bear responsibility for complying with all relevant requirements. Penalties for noncompliance must be commensurate with the offense. The current system does not yet have exit controls in place. In sum, the LDA system should meet a "truth-in-advertising" test.

- **Credible and realistic policies regarding transition from LDA to permanent immigrant status.** Realistic policies should continue to differentiate between LDAs who will

remain only temporarily and those who become permanent. For example, LDAs should continue to be able to transition to immigrant status as expeditiously as possible if they enter *bona fide* marriages with U.S. citizens or meet the justifiably high education, skill standards, and prescribed labor market tests of the permanent skill-based immigration categories.

- **Protection of workers from unfair competition and of foreign workers from exploitation and abuse**. LDA worker categories present special challenges in ensuring that U.S. workers are protected from unfair competition while legitimate foreign workers are protected from exploitation. Any system of LDA admissions must include protections for both U.S. and foreign workers, protections that are commensurate with the risk of unfair competition or abuse that the specific category presents. For example, lesser-skilled workers (whether American or foreign) who are newly entering the workforce and whose skills are easily replaced are generally more vulnerable—both to displacement and exploitation—than are more highly-skilled, specialized workers. Businesses that contract out their foreign workers to other businesses pose a greater risk for labor market violations because of the greater diffusion of employer responsibility. Also, employees of firms whose workforces consist primarily of temporary foreign workers, particularly from low-wage countries, are more vulnerable to exploitation; these foreign workers may be used to displace American workers because of their fear that any complaint about wages and working conditions might lead to deportation.

- **Appropriate attention to limited duration admission policies in trade negotiations**. Important policy decisions on admission of temporary workers occurred during negotiations on the North American Free Trade Agreement [NAFTA] and the General Agreement on Trade in Services [GATS].

Some are concerned that these treaty obligations restrict the capacity to reform our LDA policies by locking current immigration law into place or establishing minimum requirements to which changes in immigration law must adhere. In the future, both the Administration, in negotiating trade agreements, and the Congress, in passing enabling legislation, should assess more carefully the long-term ramifications of trade negotiations for immigration policy. The aim should be to ensure that options for future immigration reform are not unknowingly foreclosed.

The following recommendations aim at maximizing the potential benefits accruing from admission of LDAs while minimizing the potential harmful effects.

The Commission recommends a reorganization of the visa categories for limited duration stays in the United States to make them more coherent and understandable.

Framework

The Commission recommends a reorganization of the visa categories for limited duration stays in the United States to make them more coherent and understandable. The Commission recommends that the current proliferation of visa categories be restructured into five broad groups: official representatives; short-term visitors; foreign workers; students; and transitional family members. Subcat-

[7] The current system includes the J visa for cultural exchange, which is used for a variety of purposes, ranging from short-term visits to study and work. The workers include scholars and researchers, camp counselors, *au pairs*, and various others. Some work activities under the J visa demonstrate a clear cultural or education exchange; other work activities appear only tangentially related to the program's original purposes. Protection of U.S. workers by labor market tests and standards should apply to the latter group in the same manner as similarly situated temporary workers in other LDA categories. The Department of State should assess how better to fulfill the purpose of the Mutual Educational and Cultural Exchange Act of 1961 [Fulbright-Hays Act]. Such an analysis is particularly timely in light of the merger now being implemented between the Department of State and the United States Information Agency, which is responsible for administering the J visa.

egories of these groups may be appropriate in some cases. This reorganization reflects such shared characteristics of different visa categories as entry for like reasons, similarity in testing for eligibility, and similar duration of stay in the United States.

The definitions and objectives of the five limited duration admission groups would be:[7]

- **Official representatives** are diplomats, representatives of or to international organizations, representatives of NATO or NATO forces, and their accompanying family members. The objective of this category is to permit the United States to admit temporarily individuals who represent their governments or international organizations. The presence of official representatives in the United States is based on reciprocity; the United States expects similar treatment for its own persons in similar capacities abroad. Under current law, these individuals are admitted under the A and G visas. For the most part, members of these groups are admitted to the United States for the duration of their status as official representatives.

- **Short-term visitors** come to the United States for commercial or personal purposes. In 1995 alone, an estimated 43.5 million inbound visitors from other countries spent $76 billion on travel to and in the United States (on U.S. flag carriers, lodging, food, gifts, and entertainment).[8] This supports the U.S. national interest in encouraging tourism and business exchange. The majority of short-term visitors enter the United States under the visa waiver program, which is available for nationals of countries demonstrating little visa

[8] The 43.5 million visitors include the admission entries of individuals from countries where a visa or visa waiver is required as well as those from Canada (no visa, visa waiver, or border crossing card required) and Mexico (border crossing card required).

abuse. (For these nationalities, visas are required for all other purposes). "Nonwaiver" nationalities must possess a B visa for tourism or business, or a C visa for transit. Some short-term visitors also enter with the J visa if they are sponsored by the U.S. Information Agency [USIA] or other U.S. government agency. Short-term visitors generally have little or no effect on the U.S. labor market as they are severely limited in what they can do in the United States. Under current law, waiver visitors are admitted for ninety days, with no option for extension; visitors admitted with B visas are normally authorized a six-month stay, with flexibility to apply for another six months. Those in transit with C visas are given up to twenty-nine days' stay. The majority of visitors by their own volition stay for very short periods. This category also includes informants/witnesses (current S classification) whose temporary entry is in the U.S. national interest because their knowledge is needed for criminal prosecutions.

- **Foreign workers** are those who are coming to perform necessary services for prescribed periods of time, at the expiration of which they must either return to their home countries or, if an employer or family member petitions successfully, adjust to permanent residence. This category would serve the labor needs demonstrated by U.S. businesses with appropriate provisions to protect U.S. workers from unfair competition. Under current law, numerous types of foreign workers are admissible under the D visa for crewmembers, E visa for treaty traders and investors, H visa for "specialty workers" and other temporary workers, I visa for foreign journalists, L visa for intracompany transferees, O visa for aliens of extraordinary ability, P visa for performers and entertainers, Q visa for participants in cultural exchange programs, and R visa for religious workers. In addition, certain other workers enter under the TN provisions created

by NAFTA. There is a second, parallel system under which other workers enter with J visas because they are sponsored by an institution approved by the U.S. Information Agency to engage in cultural exchange. Some of these J workers are paid by their own governments or home institutions whereas others receive compensation from the U.S. institutions and businesses employing them. Also included as foreign workers are trainees, that is, individuals receiving on-the-job training by working in U.S. institutions. The present multiplicity of LDA work categories could be rationalized and made to parallel similar immigrant visa categories. [See below for specific recommendations regarding foreign workers.]

- **Students** are persons who are in the United States for the purpose of acquiring either academic or practical knowledge of a subject matter. This category has four major goals: to provide foreign nationals with opportunities to obtain knowledge they can take back to their home countries; to give U.S. schools access to a global pool of talented students; to permit the sharing of U.S. values and institutions with individuals from other countries; and to enhance the education of U.S. students by exposing them to foreign students and cultures. Students now enter under at least three visa categories: F visa for academic students; J visa, also for academic students (but generally including those whose education is paid by their own government or the U.S. government rather than themselves); and M visas for vocational students.

- **Transitional family members** include fiancé(e)s of U.S. citizens. These individuals differ from other LDAs because they are processed for immigrant status, although they do not receive such status until they marry in the U.S. and adjust. The Commission believes another category of transitional family members should be added: spouses of U.S.

citizens whose weddings occur overseas but who subsequently come to the U.S. to reside. At present, a U.S. citizen cannot petition for the admission of a spouse until after the marriage. Months often pass before the foreign spouse can come to the U.S. Under the Commission's plan, the newlywed should be permitted to enter the U.S. under a transitional family visa and then complete the paperwork for legal permanent resident status.

The Commission recommends that the current visa waiver pilot program for short-term business and tourist visits be made permanent upon the implementation of an entry-exit control system capable of measuring overstays.

Short-Term Visitors

The Commission recommends that the current visa waiver pilot program for short-term business and tourist visits be made permanent upon the implementation of an entry-exit control system capable of measuring overstays. A permanent visa waiver system requires appropriate provisions to expand the number of participating countries and clear and timely means for removing those countries that fail to meet the high standards reserved for this privilege. Congress should extend the pilot three years while the control system is implemented.

Most observers recognize that the waiver has been a positive factor in increased tourism and trade and in less processing time for many travelers at ports of entry. More than one-half of the short-term visitors from waivered nationalities come to the U.S. under the waiver, and INS reports little overstay or other immigration violations from these visitors. The Department of State [DOS] has been able to reallocate its relatively high-cost overseas resources to areas that need greater attention, such as increased antifraud efforts, coping with the Diversity Visa workload, and staffing new posts in the former Soviet Union. A key factor in the success of the waiver program is the electronic sharing of "watch list" data of persons ineligible for visas between the Department of State and INS on an almost immediate basis. Being able to screen visitors arriving with-

out visas at ports of entry serves the fundamental purpose of ensuring that statutorily ineligible aliens are not admitted to the United States.

Foreign Workers

Each year, more foreign workers enter the United States as LDAs for temporary work than enter as skill-based immigrants. In FY 1996, the Department of State issued almost 278,000 limited duration worker visas, including those for spouses and children. (Other LDA workers who changed status within the United States are not reflected in these statistics. Also not considered are LDA foreign students working in the United States during their course of study or as part of their practical training, or researchers entering under J visa programs.) By contrast, only 117,000 immigrant visa issuances and domestic adjustments of status in worker categories were recorded in FY 1996, far less than the legislated limit of 140,000.

The Commission recommends that the limited duration admission classification for foreign workers include three principal categories: those who, for significant and specific policy reasons, should be exempt by law from labor market protection standards; those whose admission is governed by treaty obligations; and those whose admission must adhere to specified labor market protection standards. Under this recommendation, LDA worker categories would be organized around the same principles that guide permanent worker categories. LDA workers would be subject to rigorous tests of their impact on the labor market unless they are exempt from these tests because their admission will generate substantial economic growth and/or significantly enhance U.S. intellectual and cultural strength and pose little potential for undermining the employment prospects and remuneration of U.S. workers.

The Commission recommends that the limited duration admission classification for foreign workers include three principal categories: those who, for significant and specific policy reasons, should be exempt by law from labor market protection standards; those whose admission is governed by treaty obligations; and those whose admission must adhere to specified labor market protection standards.

Within the labor market protection standards group, criteria for admission are consistent with the potential adverse effect of given categories of workers. The Commission believes adverse impact is broadly related to educational and skill level of the affected workers. Although there sometimes is an adverse effect from even the most highly-skilled and experienced foreign workers, the benefits of such workers are usually large to American society as a whole. They are likely to enhance the U.S. national interest through the generation of economic activity, including the creation of jobs. In general, the higher the levels of education and skill required in a given occupation, the more likely U.S. workers will be able to compete successfully with workers from abroad. Even at the very highest levels of skill and education, however, this generalization fits some high-skill occupations, but not others.

Entry-level professionals and lesser-skilled workers pose somewhat greater risk of displacing U.S. workers because their work can more likely substitute for that of U.S. workers. If they accept lower wages and benefits or poorer working conditions, they present unfair competition to U.S. workers and their employers may gain an unfair advantage over other U.S. employers. Similarly, unskilled foreign workers present the greatest potential for adverse impact because they are competing with some of the most vulnerable of American workers. Accordingly, the Commission proposes different sub-categories with labor market protection standards commensurate with the risks we believe are posed by the workers.

- **Those exempt by law from labor market protection standards** because their admission will generate substantial economic growth and/or significantly enhance U.S. intellectual and cultural strength and pose little potential for undermining the employment prospects and remuneration of U.S. workers. These include:

Individuals of extraordinary ability in the sciences, arts, education, business, or athletics, demonstrated through sustained national or international acclaim and recognized for extraordinary achievements in their field of expertise. These individuals now enter under the O visa. This category is comparable to the first priority in our permanent resident system. The U.S. national interest is well served by entry of individuals at the very top of their chosen fields who can contribute during their temporary stay to U.S. economic growth and intellectual and cultural strength.

Managers and executives of international businesses (current L visa), also comparable to the first priority in the legal permanent resident system. The global competitiveness of U.S. businesses is enhanced by the capacity of multinational corporations to move their senior staff around the world as needed. Often, there is only temporary need for a transfer, although permanent relocation may later be required. Under current law, the person with a LDA visa must have been employed by the firm, corporation, affiliate or subsidiary continuously for one year within the three years preceding the application for admission. As discussed below, the Commission believes greater safeguards must be in place to ensure that only *bona fide* international businesses benefit from this policy.

Professors, researchers and scholars whose salary or other compensation is paid by their home government, home institution, or the U.S. government in a special program for foreign professors, researchers, and scholars. Each year, professors, researchers, and scholars enter the United States on sabbatical from their own universities or research institutes, often with a J visa. Also in this category are foreign members of research teams cofunded by the United States and

other countries. These individuals present substantial benefits to the United States in the expertise and resources they bring, and they pose no threat of displacement of U.S. researchers as their salaries are from foreign sources or they enter under a U.S. government-funded program, such as the Fulbright Program, whose resources are earmarked through an appropriation process for foreign researchers and scholars.

Religious workers, including ministers of religion and professionals and other workers employed by religious nonprofit organizations in the U.S. to perform religious vocations and religious occupations. Under current law, religious workers must have had at least two years' prior membership in the religious organization (current R visa).

Members of the foreign media admitted under reciprocal agreements (current I visa). The U.S. benefits from the presence of members of the foreign media who help people in their countries understand events in the United States. Just as we would not want our media to be overly regulated by labor policies of foreign governments, the United States extends the same courtesy to foreign journalists working in the U.S.

- **Foreign workers whose admission is subject to treaty obligations.** This includes treaty traders, treaty investors, and other workers entering under specific treaties between the U.S. and the foreign nation of which the alien is a citizen or national. Under the provisions of NAFTA, for example, Canadian professionals are not subject to numerical limits or labor market testing; Mexican professionals continue to be subject to labor market tests, but will be exempt from numerical limits in 2003.

- **Foreign workers subject by law to labor market protection standards.** These are principally:

  Professionals and other workers who are sought by employers because of their highly-specialized skills or knowledge and/or *extensive experience*. Included in this category are employees of international businesses who have specialized knowledge (now admitted under the L visa) and professionals (now covered by the H-1B visa). A diverse range of individuals may be admitted in this category, including, but not limited to, university faculty and researchers with advanced degrees, accountants and lawyers with specialized knowledge of the tax and legal codes of other countries, and electrical engineers and software systems engineers with specialized knowledge needed for systems design. This category would also cover highly-skilled workers without professional degrees if they have substantial experience in their occupation. This category includes as well aliens now admitted under the H-1B visa who have a bachelor's degree but little specialized expertise or experience.

  Trainees admitted to the United States for practical, on-the-job training in a variety of occupations. They now enter through the H-3 visa, practical training arrangements under the F visa, and the J visa provisions pertaining to physicians seeking graduate medical education and to some researchers with J visas engaged in post-doctoral studies. All of these groups have in common work in U.S. institutions as part of a training program. They are paid U.S. wages and, in many cases, are not readily distinguished from U.S. residents in the same type of on-the-job training activities.

  Institutions petitioning for foreign workers as trainees would be required to demonstrate that the principal purpose of the

program is training by showing a significant educational component to the work experience. Trainees would be paid the actual wages provided to U.S. trainees in similar programs. The trainees would be admitted for the specified duration of the training program. For example, a foreign physician admitted for graduate medical education would be admitted for the period of the specific residency program.

Artists, musicians, entertainers, athletes, fashion models, and participants in international cultural groups that share the history, culture, and traditions of their country. This category includes aliens now admitted under the P visa and Q visa, as well as fashion models admitted under H-1B visa, and athletes, musicians and other performers admitted under the H-2B visa.

Lesser-skilled and unskilled workers coming for seasonal or other short-term employment. Such worker programs warrant strict review, as described below. This category includes aliens now admitted with H-2A and H-2B visas. Requests for admission of unskilled and lesser-skilled workers should be met with heightened scrutiny. Temporary worker programs for lesser-skilled agricultural workers exert particularly harmful effects on the United States. The Commission remains opposed to implementation of a large-scale program for temporary admission of lesser-skilled and unskilled workers along the lines of the *bracero* program. Having examined the issue further during our consultations on LDA issues, we reaffirm our belief that a new guestworker program would be a grievous mistake.

Historically, guestworker programs have depressed the wages and working conditions of U.S. workers. Of particular concern is competition with unskilled American work-

ers, including recent immigrants who may have originally entered to perform the needed labor but who can be displaced by newly entering guestworkers. Foreign guestworkers often are more exploitable than lawful U.S. workers, particularly when an employer threatens deportation if the workers complain about wages or working conditions. The presence of large numbers of guestworkers in particular localities—such as rural counties with agricultural interests—presents substantial costs for housing, health care, social services, schooling, and basic infrastructure that are borne by the broader community and even by the federal government rather than by the employers who benefit from the inexpensive labor.

Despite the claims of their supporters, guestworker programs also fail to reduce unauthorized migration. To the contrary, research consistently shows that they tend to encourage and exacerbate illegal movements by setting up labor recruitment and family networks that persist long after the guestworker programs end. Moreover, guestworkers themselves often remain permanently and illegally in the country in violation of the conditions of their admission.

If new initiatives to reduce illegal migration were at some point to create real labor shortages in agriculture or other low-skill occupations, employers could request foreign workers through the LDA provisions that the Commission proposes for the admission of unskilled workers.

The Commission recommends that the labor market tests used in admitting temporary workers in this category be commensurate with the skill level and experience of the worker.

The Commission recommends that the labor market tests used in admitting temporary workers in this category be commensurate with the skill level and experience of the worker.

- **Employers requesting the admission of temporary workers with highly-specialized skills or extensive experience**

should meet specific requirements. Admission should be contingent on an attestation that:

The employer will pay the greater of actual or prevailing wage and fringe benefits paid by the employer to other employees with similar experience and qualifications for the specific employment in question. Actual wage rates should be defined in a simple and straightforward manner. By this recommendation, we do not intend a complicated, bureaucratically-defined wage analysis. Rather, businesses should be able to use their own compensation systems to determine appropriate wages and benefits for the individual foreign worker hired. The entry of a small number of highly-skilled foreign workers should have minimal effect on these wage scales, which will be determined by the majority of U.S. workers employed by the business. In the absence of a company-wide system that ensures equitable compensation for similarly situated workers, the employer would be required to attest to paying prevailing wages for that job category, wages that are typical of the enterprise or nonprofit company. [See below for recommendations for at-risk employers with a significant proportion of foreign workers.]

The employer has posted notice of the hire, informed coworkers at the principal place of business at which the LDA worker is employed and provided a copy of the attestation to the LDA worker employed.

The employer has paid a reasonable user fee that will be dedicated to facilitating the processing of applications and the costs of auditing compliance with all requirements. Currently no fees are collected by the Department of Labor [DOL] for either processing or monitoring purposes. In effect, this requires taxpayers to subsidize these programs.

To ensure that the employer, and not the foreign worker, pays the user fee, penalties should be imposed upon violators.

There is no strike or lockout in the course of a labor dispute involving the occupational classification at the place of employment.

The employer has not dismissed, except for cause, or otherwise displaced workers in the specific job for which the alien is hired during the previous six months. Further, the employer will not displace or lay off, except for cause, U.S. workers in the specific job during the ninety-day period following the filing of an application or the ninety-day periods preceding or following the filing of any visa petition supported by the application.

The employer will provide working conditions for such temporary workers that are comparable to those provided to similarly situated U.S. workers.

- **Certain at-risk employers of skilled workers [described** below] should be required to attest to having taken significant steps—for example, recruitment or training—to **employ U.S. workers in the jobs for which they are recruiting foreign workers.** The Commission is aware that some companies now petitioning for H-1B workers recruit exclusively in foreign countries. The Commission believes that U.S. recruitment or hiring efforts will help ensure that qualified U.S. citizens and permanent residents have access to these jobs. We do not recommend, however, that current labor certification processes be used to document significant efforts to recruit. These procedures are costly, time consuming, and ultimately ineffective in protecting highly-skilled U.S. workers.

Under the now expired H-1A visa program for the admission of LDA registered nurses, several alternative steps were described as meeting the requirement of timely and significant steps to employ U.S. workers. These alternatives include: operating a training program for such workers at the facility (or providing participation in a training program elsewhere); providing career development programs and other methods of facilitating workers to become qualified; paying qualified workers at a rate higher than currently paid to other similarly employed workers in the geographic area; and providing reasonable opportunities for meaningful salary advancement. Examples of other steps that might qualify as meeting the timely and significant requirement include monetary incentives, special perquisites, work schedule options, and other training options.

- **Employers requesting the admission of lesser-skilled workers should be required to meet a stricter labor market protection test.** Such employers should continue to be required to demonstrate that they have sought, but were unable to find, sufficient American workers prepared to work under favorable wages, benefits, and working conditions. They also should be required to specify the steps they are taking to recruit and retain U.S. workers, as well as their plans to reduce dependence on foreign labor through hiring of U.S. workers or other means. (For example, sugar cane growers in southern Florida who had petitioned for foreign workers had success in reducing their dependence on H-2A workers through mechanization.) Employers should continue to be required to pay the highest of prevailing, minimum, or adverse wage rates, provide return transportation, and offer decent housing, health care, and other benefits appropriate for seasonal employees.

The Commission recommends that categories of employers who are at special risk of violating labor market protection standards—regardless of the education, skill, or experience level of its employees—be required to obtain regular independently-conducted audits of their compliance with the attestations made about labor market protection standards, with the results of such audit being submitted for Department of Labor review. Certain businesses, as described below, pose greater risk than others of displacing U.S. workers and/or exploiting foreign workers. The risk factors that should be considered in determining whether stricter protection standards must apply include:

The Commission recommends that categories of employers who are at special risk of violating labor market protection standards be required to obtain regular independently-conducted audits of their compliance with the attestations made about labor market protection standards.

- **The employer's extensive use of temporary foreign workers.** Extensive use can be defined by the percentage of the employer's workforce that is comprised of LDA workers. It also can be measured by the duration and frequency of the employer's use of temporary foreign workers.

- **The employer's history of employing temporary foreign workers.** Those employers with a history of serious violations of regular labor market protection standards or specific labor standards related to the employment of LDA workers should be considered as at risk for future violations.

- **The employer's status as a job contracting or employment agency providing temporary foreign labor to other employers.** Risk of labor violations increases as responsibility is divided between a primary and secondary employer.

To ensure adequate protection of labor market standards, such employers should be required to submit an independent audit of their compliance with all statements attested in their application. The independent audits should be done by recognized accounting firms that have the demonstrated capacity to determine, for example, that

The Commission recommends enhanced monitoring of and enforcement against fraudulent applications and postadmission violations of labor market protection standards.

wages and fringe benefits were provided as promised in the attestation and conformed to the actual or prevailing wages and fringe benefits provided to similarly situated U.S. workers.

The Commission recommends enhanced monitoring of and enforcement against fraudulent applications and postadmission violations of labor market protection standards. To function effectively, both the exempt and nonexempt temporary worker programs must provide expeditious access to needed labor. The Commission's recommendations build on the current system of employer attestations that receive expeditious preapproval review but are subject to postapproval enforcement actions against violators. To ensure adequate safeguards for U.S. workers, the government agencies responsible for processing applications and enforcing the law must have adequate capacity to identify and act quickly against fraudulent applicants and to monitor postapproval violations of the terms under which foreign workers enter. More specifically, the Commission recommends:

- **Allocating increased staff and resources to the agencies responsible for adjudicating applications for admission and monitoring and taking appropriate enforcement action against fraudulent applicants and violators of labor market protection standards.** These agencies require additional resources to investigate potential fraud among applicants for temporary worker visas as well as violations of the labor market protection standards. Enhancing this capability has significant resource implications, especially if, as the Commission also recommends, such antifraud investigations are undertaken in a manner that does not delay visa adjudication and issuance. Increased costs required for more efficient adjudication of applications can be covered by applicant fees. However, additional costs incurred for more effective investigations of compliance with labor market standards will require appropriated funds.

Sufficient funds should be appropriated to provide the additional resources needed for adequate enforcement by the Department of Labor. These resources should be targeted at employers and contractors at special risk of violating labor market protection standards. Targeting these employers makes the most sense both in terms of economical use of resources and in protection of workers.

The Department of State also must have the capacity to make a proper investigation of cases in which fraud is suspected. This capacity is particularly needed in applications for admission of LDAs in exempt categories to ensure that use of these categories does not become a means of evading labor market protection standards. For example, the visa for intracompany transfers has been abused by persons setting up sham corporations. To comply with appropriate requirements for timely decisions, the government must have the resources to investigate suspected fraud.

- **Barring the use of LDA workers by any employer who has been found to have committed willful and serious labor standards violations with respect to the employment of LDA workers. Further, upon the recommendation of any federal, state, or local tax agency, barring the use of LDA workers by any employer who has been found to have committed willful and serious payroll tax violations with respect to LDA workers.** The law currently provides for such debarment for failure to meet labor condition attestation provisions or misrepresentation of material facts on the application. Implementation of this recommendation would enable penalties to be assessed for serious labor standards violations that are not also violations of the attestations. This would address an issue that has come to the attention of the Commission: the knowing misclassification of some

LDA workers as independent contractors, with subsequent failure to pay payroll taxes or other legally-required deductions to the appropriate governmental agency.

- **Developing an enforcement strategy to reduce evasion of the LDA labor market protection standards through use of contractors.** U.S. businesses' growth in contracting-out functions has raised questions of employment relationships and ultimate liability for employment-related violations, including those related to temporary foreign workers. A uniform policy for dealing with these situations is desirable for the enforcement agencies involved, as well as for employers, contractors, and workers.

Conclusion

Limited duration admissions are an important part of immigration policy because they are linked closely to the admission of legal permanent immigrants and to our policies for deterring unlawful migration. This report seeks to treat limited duration admission policy in a comprehensive fashion, building on the recommendations made by the Commission on other aspects of immigration policy. The opportunities presented by the admission of limited duration admissions are significant. With the type of regulation recommended herein, the United States will be able to continue to benefit from these admissions while mitigating potential harmful effects, particularly on vulnerable U.S. populations.

CURBING UNLAWFUL MIGRATION

In its first interim report to Congress this Commission recommended a comprehensive strategy to curb unlawful migration into the United States through prevention and removal.[9] That report focused on deterrence—steps that could prevent illegal entry and unauthorized work. The Commission found that curbing unlawful immigration required: (1) better border management; (2) more effective deterrence of the employment of unauthorized workers; (3) a more consistent benefits eligibility policy; (4) cooperative efforts with source countries; (5) improved data collection and analysis; (6) mechanisms to address migration emergencies; (7) and an improved capacity to remove deportable aliens. The Commission presented detailed recommendations on the first five elements of this strategy (border, worksite, benefits, source country, and data). Our report on refugee policy detailed more specific recommendations on the sixth, migration emergencies.[10] This final report provides more detailed recommendations on the seventh, removals.

Since 1994, the immigration system as a whole has undergone almost unprecedented change. As Congress, the public, and the Administration focused more keenly on immigration, the financial resources available to INS grew from $1.5 billion in FY 1994 to a projected $3.6 billion in FY 1998. During the same period, INS staffing is expected to rise 65 percent, from 17,000 in FY 1994 to more than 28,000 in FY 1998. Once in 1994,[11] and three times in 1996,[12] enactment of major legislation made substantive and substantial changes in laws affecting illegal migration. Many of these statutory and administrative actions sought to implement the Commission's 1994 recommendations.

Deterrence Strategies

The Commission reiterates its 1994 recommendations supporting a comprehensive strategy to deter illegal migration.

The Commission reiterates its 1994 recommendations supporting a comprehensive strategy to deter illegal migration. Despite the additional resources, new policies, and often innovative strategies adopted during the past few years, illegal migration continues to be a problem. In October 1996, INS released its latest estimates of the illegal alien population in the United States: some 5 million undocumented migrants reside in the United States, a number growing by approximately 275,000 annually; 41 percent of these are nonimmigrant overstays; the remaining 59 percent probably entered illegally and without inspection.

The Commission continues to believe that unlawful immigration can be controlled consistent with our traditions, civil rights, and civil liberties. As a nation committed to the rule of law, our immigration policies must conform to the highest standards of integrity and efficiency in the enforcement of the law. We must also respect due process. The Commission believes that the comprehensive strategy we outlined in 1994 continues to hold the best promise for reducing levels of illegal migration. These policies, combined with the structural and management recommendations detailed later in this report, can restore the credibility of our immigration system by both deterring illegal entry and facilitating legal crossings. The Commission emphasizes, however, that no one part of this strategy will, on its own, solve the problem of unauthorized migration.

More specifically, the Commission continues to support implementation of the following deterrence strategies:

- **An effective border management policy that accomplishes the twin goals of preventing illegal entries and facilitating legal ones.** Increased resources for additional Border Patrol officers, inspectors, and operational support, combined with

such new strategies as operations "Hold the Line," "Gatekeeper," and "Safeguard," have improved significantly the management of the border where they are deployed. The very success of these new efforts demonstrates that to gain full control, the same level of resources and prevention strategies must be deployed at all points along the border where significant violations of U.S. immigration law are likely to occur.

Implementing effective prevention strategies. In 1994, "Operation Hold the Line" in El Paso, Texas successfully challenged outmoded border control concepts. This effort then served as the model for efforts to control other parts of the border, particularly in the San Diego area. The result, "Operation Gatekeeper," utilizing a strategy described as "Prevention through Deterrence," began on October 1, 1994, and included the commitment of significant new resources and the implementation of innovative new strategies.

Phase I (1994) of the plan had the greatest impact on the area around Imperial Beach in San Diego County. For many years this area accounted for approximately 25 percent of illegal crossings across the southwest border. Utilization of new equipment led to apprehension of greater numbers, and use of new techniques cracked down on alien smuggling rings. Reinforcement of interior checkpoints helped capture those who made it illegally across the border.

Phase II (begun in June 1995) consisted mainly of reinforcing nearby ports of entry seen as the next likely route for aliens whose illegal entry was disrupted by "Operation Gatekeeper." INS placed additional service inspectors at the border, constructed fencing at strategic locations, installed a fingerprint identification system , and added increased lighting at ports of entry.

Phase III (begun in 1996) is designed to extend control over increasing sections of the southwest border as additional staff and equipment become available. The San Diego Border Patrol Sector now has almost 2,000 agents working along the border.

Where these new initiatives have been instituted, the number of people seeking to cross is significantly reduced. On Commission site visits, residents of El Paso and Imperial Beach, the main beneficiaries to date of the new enforcement efforts, cited reduction in vagrancy and petty crime as evidence of reduced illegal crossings through their communities. Preliminary research data reveal that it now takes longer and costs more to enter the United States illegally. Illegal migrants now must now cross through tougher terrain and need the assistance of smugglers. Migrant smuggling increasingly is becoming specialized and professionalized.

The 1997 Binational Study, *Migration Between Mexico and the United States,* reports that a systematic survey of border crossers indicates fewer actual crossers but longer periods of stay in the United States. Thus, it appears that while new border initiatives may deter some movements, they do not fully reduce either levels or impacts of illegal migration. In other words, border control is a necessary, but not sufficient, response to illegal migration.

Evidence also shows that in response to the new initiatives migrants have shifted their entry patterns. For example, as Imperial Beach and its neighboring communities came under control, the numbers of illegal entries rose in eastern San Diego county, the Imperial Valley, Arizona, and south Texas. As the Commission noted in 1994, the immigration

system must have the capacity to prevent entry across the southern border. Mobile, rapid response teams initially can help plug holes along the border, but eventually, a prevention capacity must be established in every likely crossing area.

Protecting human rights. Effective border management is not without its human toll, increased violence along the border, as well as deaths resulting from exposure to extreme weather in mountain and desert areas. Both border crossers and Border Patrol agents have been victims of this heightened violence.

Since the implementation of the border initiatives, incidents of violence against the Border Patrol have increased. Incidents of rock-throwing, a hazard to Border Patrol agents for years, have risen. Agents now face random gunfire from south of the border. Beginning in May of 1997, six reported sniper shootings in the San Diego sector were directed at Border Patrol agents. Sustained efforts to protect agents from such violence must be at the top of the policy agenda.

Efforts also must continue to warn potential illegal border crossers—while they are still in their countries of origin—of the increased physical dangers and legal consequences of trying to cross illegally. In particular aliens must be warned of the pitfalls of using smugglers, some of whom abandon border crossers and otherwise abuse them.

Site visits in Mexico demonstrate that already widespread knowledge exists about the new difficulties in entering the United States illegally; misinformation continues to abound as well. Residents in new sending regions such as Oaxaca, traditional sending regions such as Jalisco, and border cross-

ing points such as Tijuana, all spoke of the additional costs and dangers encountered in attempting to cross the border illegally.

The Commission continues to support efforts to monitor and reduce human rights violations and potentially violent confrontations between government personnel and those believed to be seeking illegal entry into the United States. The INS formed a Citizens' Advisory Panel [CAP] that met periodically from February 1994 through February 1997, a year beyond its original expiration date. During that time, the CAP discussed ways and means for averting potential human rights abuses and outright violence by INS employees against aliens. As a result, INS adopted a formal complaint procedure for reporting alleged abuses by government employees to their supervisors and for INS to respond to those complaints. At its February 1997 meeting, the CAP decided to disband in its present form. Discussions are now underway on how best to retain the CAP input in the INS decisionmaking processes, in delivering feedback for training and supervising INS border personnel, and in responding to complaints made against employees.

Improving ports of entry. Additional pressure on ports of entry also accompany enhanced border control. The various initiatives already undertaken provide guidance for other border sites. In San Diego, "Operation Gatekeeper II" included enhanced resources for inspectors to identify individuals entering with fraudulent documents or as impostors. A Port Court was established to place these persons into formal exclusion proceedings. Presiding Immigration Judges made clear to those receiving exclusion orders that they would face criminal penalties if they were apprehended attempting to reenter within one year. To ensure that word went out that these were not idle threats, the U.S. Attorney

pledged to prosecute these cases. A relatively small number of persons were apprehended attempting reentry after receiving an exclusion order at the Port Court.

This process has changed somewhat under the new expedited removal procedures mandated by the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, which took effect on April 1, 1997. Under the new procedures, an alien arriving at a port of entry with fraudulent documents or without documents is referred to secondary inspection, where he or she is advised about expedited removal.[13] If the alien does not indicate a fear of persecution or an intent to apply for asylum, the alien is fingerprinted, photographed and detained until removal, which in San Diego typically takes two processing days. The alien's identity is recorded in the INS IDENT database for immediate and future determination of repeated attempts at unlawful reentry. An immigration officer's determination to remove an alien under the expedited procedures is not subject to administrative or judicial review, except under only very narrow circumstances.

Immigration officials in San Diego report a significant increase in removals as a result of the new expedited removal provisions. These gains in the capacity to remove at the border are no doubt desirable goals for an immigration enforcement agency. However, a more reliable determinant

[13] IIRIRA permits the Attorney General to apply the expedited removal provisions to aliens in the U.S. who have not been admitted or paroled [EWIs] and who have not shown to the satisfaction of the immigration officer that they have been continuously present in the U.S. for the two-year period immediately preceding the date of the determination of inadmissibility. At present, the Attorney General has elected not to apply these provisions to EWIs, although she has reserved through regulation, the option to apply the expedited removal provisions at any time, to any alien specified in that section.

of the extent to which a law actually deters the conduct it seeks to address is the recidivism rate. Thus, the effective communication of the consequences attached to the removal of an alien as a result of the new provisions is a key ingredient of the efficacy of our immigration laws. Without such public education, certain individuals are likely to be undeterred by the type of sanction exacted under the new expedited removal procedures.

Although reliable data on reentry is not yet available, the San Diego district reports an apparent increase in recidivism following implementation of the new law. It appears that an order issued by an immigration inspector does not have the psychological force of an order issued by an Immigration Judge. What is gained in expediting by the new statutory process may be lost in increased recidivism.

To counter this trend, the San Diego district has instituted a three-strike system that corresponds with the changes mandated by the new law. This system was established with the cooperation of the INS, the Executive Office for Immigration Review [EOIR], and the U.S. Attorney's Office in response to reports of apparent recidivism among aliens turned away by the expedited removal process. The first strike occurs once the INS inspector issues an expedited removal order to the alien that carries a penalty of inadmissibility for up to twenty years in some cases and permanently if the offense involves the use of a fraudulent document.

The second strike—appearance before an Immigration Judge in Port Court—occurs once the alien is apprehended after having been removed for a previous immigration or criminal violation. This step provides a critical link to deterrence: personal communication of the consequences of violating an immigration law. At the hearing, the Immigration

Judge advises the alien of the administrative sanction resulting from the attempted illegal reentry after expedited removal (i.e., a bar to admission for some period) and also of the certainty of felony prosecution if the alien attempts reentry during that period. The presence of an Immigration Judge is considered a vital component to the credibility of the San Diego district's border enforcement. The clear, unequivocal notice of the penalty aliens are likely to incur at the third step, coupled with the prospect of time spent in prison, is predicted to have more of a deterrent effect than simply turning aliens away without providing adequate notice of the consequences of their conduct.

The third strike involves felony prosecution by the U.S. Attorney's office under 8 U.S.C. § 1326(a) for illegal reentry following deportation, exclusion, or removal or under § 1326(b) for illegal reentry by certain criminal aliens who likewise have been previously removed. The penalties for a conviction under these sections of Title 8 range from sentences of not more than two years to not more than twenty years and/or a fine.

The INS and the Border Patrol are in the process of linking the IDENT system to all sectors along the southwest U.S.-Mexican border. This is especially important in light of the apparent shift in border movements to the east. Moreover, proper coordination of this system with various other law enforcement agencies to identify criminal aliens and other immigration violators may enhance the cooperation between those agencies and heighten enforcement along the border. For example, within the constraints of privacy limitations, data on criminal aliens entered into the IDENT system and furnished to the U.S. Attorney's Office would allow that office more readily to identify and prepare the criminal alien cases it intends to prosecute under the § 1326 provisions.

San Diego also is a laboratory for initiatives to facilitate legal entries while guarding against the abuses referenced above. The Commission urged in its 1994 report that port of entry operations be improved to reduce long waiting times for legal crossings. We learned in El Paso that some illegal crossers had legal authority to enter, but because of the long waits, chose to use unauthorized avenues to enter. San Diego, along with several northern border sites, has been experimenting with a Dedicated Commuter Lane [DCL] to speed legitimate border traffic. This concept combines upfront screening of the applicant for a commuter pass and use of technology to ensure that the crosser is indeed the person who previously was screened. Another innovation in San Diego is a new working relationship between INS inspections and the Customs Service to open all traffic lanes and to improve the division of responsibility: INS currently runs the port for pedestrian crossing and Customs for cargo inspections. Responsibility for inspections at the vehicle lanes still is shared by INS and Customs.

Reducing visa overstay and abuse. Visa overstay and abuse of visas and Border Crossing Cards [BCCs], particularly through unauthorized work, continue to challenge effective border management. Most of those entering with visas and BCCs come for legitimate purposes, abide by the terms of their entry, and leave when required. Out of the millions of aliens who are inspected each year, only a very small proportion (about 150,000 per year) overstay for significant periods. Any efforts to reduce abuse must also consider the widespread benefits that accrue from most visa and BCC holders. A number of policy changes could help ease legal entry while reducing abuse. The Commission previously recommended, and Congress and the Administration have taken

action for, the development of new entry-exit controls for persons entering with visas, reissuance of Border Crossing Cards to give them greater integrity, and providing significant new resources for inspections.

Monitoring and evaluating new initiatives. The various intended and unintended consequences of the new resources, policies, and initiatives in and between ports of entry make clear the need for careful monitoring. The Commission reiterates its 1994 recommendation that a systematic assessment of the effectiveness of new border strategies be undertaken by internal and external evaluators. IIRIRA mandates a General Accounting Office five-year evaluation of border management. This study should be underwritten with sufficient resources and expertise to ensure that Congress and the Executive Branch gain an independent view of the new policies' effectiveness.

- **Reducing the employment magnet is the linchpin of a comprehensive strategy to deter unlawful immigration.** Economic opportunity and the prospect of employment remain the most important draw for illegal migration to this country. Strategies to deter unlawful entries and visa overstays require both a reliable process for verifying authorization to work and an enforcement capacity to ensure that employers adhere to all immigration-related labor standards. The Commission continues to believe the following areas of worksite regulation and enforcement require improvement:

Employment authorization verification system. In our 1994 report, the Commission concluded that the single most important step that could be taken to reduce unlawful migration was development of a more effective system for verifying work authorization.

A large majority of employers will comply with the law, and they will not knowingly hire illegal aliens. However, the widespread availability of fraudulent documents makes it easy for illegal aliens to obtain jobs because employers generally have no way of determining if the workers are authorized or not. The minority of employers who knowingly hire illegal aliens, often to exploit their labor, find protection from sanctions by going through the motions of compliance while accepting counterfeit documents. The absence of a secure verification process also heightens the potential for discrimination against legally-authorized, foreign-looking or -sounding workers because employers fear that they may be inadvertently hiring illegal aliens.

The Commission concluded that the most promising option for verifying work authorization is a computerized registry based on the social security number; it unanimously recommended that such a system be tested not only for its effectiveness in deterring the employment of illegal aliens, but also for its protections against discrimination and infringements on civil liberties and privacy.[14] The Commission urged the Administration "to initiate and evaluate pilot programs using the proposed, social security-based computerized verification system in at least five states with the highest levels of illegal immigration . . ." In the interim, we recommended that INS should continue to implement pilot programs already underway that permit employers to verify the work authorization of these newly-hired workers who attest to being aliens. The existing pilot, since expanded, was a good mechanism through which INS could develop the data and other systems that would be needed in the more extensive pilots envisioned by the Commission. They continued to

[14] The Concurring Statement of Commissioners Leiden and Merced can be found in the Commission's 1994 report.

have a fatal flaw, however, in that an illegal alien could attest to being a U.S. citizen and thereby escape verification by INS.

The Commission's recommendation for a verification pilot that involved both citizens and aliens was incorporated in modified form in IIRIRA.[15] Congress mandated that the Attorney General establish a pilot confirmation system using a telephone line or other electronic media. The Commissioner of Social Security was mandated to establish a reliable, secure method to verify the social security number provided by a new hire as part of the employment confirmation process. Pilot programs testing the new confirmation process were to be implemented in, at a minimum, five of the seven states with the highest estimated illegal alien population. Participation in the pilot programs is to be voluntary for most employers. The legislation mandated participation by federal agencies and the Congress. Companies violating employer sanctions provisions can also be required to participate. The Attorney General is to report on the pilot programs after three and four years of operation.

The first of these pilot projects was to begin not later than one year from enactment of IIRIRA, or about August 1997. The first pilot project, starting in Chicago, began in late August. Called the "Joint Employment Verification Project" [JEVP], the pilot involves INS and the Social Security Administration. The verification pilot will test many of the requirements of the "Basic Pilot Program" mandated in § 403(a) of IIRIRA.

---

[15] IIRIRA, Title IV—Enforcement of Restrictions Against Employment, Subtitle A: Pilot Programs for Employment Eligibility Confirmation, sections 401-405.

The JEVP will have prospective new employees fill out the current INS Form I-9, submit identification documents listed in the legislation, and include a photograph. Employers will then contact the Social Security Administration [SSA] through a touch-tone telephone (being developed under a contract with ATT) that will electronically verify identity and authorization/nonauthorization to work using the employee's social security number. If either of these is not confirmed, the prospective employee must be notified. The employee may then withdraw or contest this tentative nonconfirmation. In this case, the prospective employee has ten days in which to provide additional or corrected information to the employer. If this still does not produce confirmation of employment authorization, the employee will be told to contact SSA [for citizens] or INS [for noncitizens] to correct their record(s) and/or their status. During this confirmation process, employees cannot be terminated. If still unconfirmed at the end of the process, the employee then may be terminated. As mandated by IIRIRA, INS plans to expand implementation of the JEVP into five additional states by the end of September 1997.

In addition, IIRIRA mandates two other pilot projects, a "citizen attestation pilot project" and a "machine readable document pilot project." INS currently is formulating these additional pilot projects. The "citizen attestation pilot project" will be similar to the INS' current Employment Verification Program, while the "machine readable document pilot project" is a variation of the JEVP and the "Basic Pilot Project."

The current pilot programs are a useful step in improving verification, but they do not fully solve the problems we have identified. The Commission reiterates its support for

pilot-testing approaches that do not require employers to use the current I-9 procedure. The I-9 is flawed in several ways. First it is a document system, which is prone to counterfeiting. Second, it requires employees to specify if they are citizens or aliens. This latter requirement increases the potential for discrimination based on alienage or presumed alienage. Third, it presents an added paperwork burden for employers who must keep the I-9 file. The current pilot programs help address the first problem by providing for telephone or computer verification of information provided in the I-9. It does not address the second or third problems, however.

A system based on verification of an employee's social security number, with a match to records on work authorization for aliens, eliminates any determinations by the employer and can be implemented electronically, thus eliminating the need for work authorization documents. The Commission recognizes that the data systems are not yet in place for this preferred process to work. The federal government does not have the capacity to match social security numbers with INS work authorization data without some of the information captured on the I-9. Congress should provide sufficient time, resources, and authorities to permit development of this capability.

The Commission urges the Administration and Congress to monitor closely and evaluate the effects of these various pilot programs. As discussed in our earlier report, the evaluation should assess their effects in reducing fraud, reducing the potential for discrimination, reducing emplyers' time, resources, and amount of paperwork, and protecting privacy and civil liberties. The evaluation should be carried out by nationally-respected outside evaluators. It should be

conceived as a continuing evaluation whose results are used in modifying and improving the pilots as they are implemented.

Counterfeit documents. The Commission recommended action to reduce the availability of counterfeit documents and the fraudulent access to so-called "breeder documents," particularly birth certificates used to establish identity. The Commission is pleased to note progress in the development of new and more tamper-proof basic documents that could serve as verification documents until a general, nationwide verification system is fully in place. The Commission also believes that the federal government should develop a package of incentives and disincentives to encourage states and other localities to develop standards for issuing birth and death certificates and drivers' licenses. The Commission is pleased to note that its 1994 recommendation for imposing additional penalties on those producing and selling counterfeit documents was adopted in the IIRIRA.

Antidiscrimination strategies. In its 1994 report, the Commission expressed its concern regarding the discrimination that occurs against citizens and noncitizens as a result of the current employer sanctions system. To address this issue, the Commission recommended development of a new verification process to deter immigration-related discrimination. We also urged more proactive strategies to identify and combat immigration-related discrimination at the workplace, as well as a new study to document the nature and extent of the problem. Revisiting this issue three years later, the Commission finds that there have been a number of changes that are relevant to the Commission's recommendations.

First, the Office of Special Counsel [OSC] for unfair immi-

gration-related employment practices, formerly housed as an independent agency within the Department of Justice, has been incorporated into the DOJ's Civil Rights Division. This organizational change seems to have been well received within the Department as both the Division and OSC focus on protecting the rights of immigrants and racial and ethnic minorities.

The number of OSC staff, however, has decreased from thirty-six to about twenty-five since FY 1994. This downward trend harms OSC's ability to take the proactive role that the Commission recommended (e.g. increasing independent, targeted investigations and beginning testing programs). The Commission urges attention to this matter, as well as to the long delay in confirming a Special Counsel to head the office.

A significant portion of OSC's efforts have been directed toward the education of employees and employers, and we support these efforts. OSC has awarded 114 grants totaling $2.09 million since FY 1990 and contracted out for a five-year national public affairs/communications strategy. Its attorneys and staff have made 1,000 presentations in the last ten years, and its grantees have averaged 1,700 presentations per year. OSC also has coordinated its educational efforts with the Equal Employment Opportunity Commission, INS, and DOL and has Memoranda of Understanding with these and other agencies.

Despite this apparent coordination, however, OSC has not been involved in designing and monitoring the verification pilot programs. Reducing immigration-related employment discrimination against foreign-looking or -sounding persons was a key goal of the Commission's proposed verification

system. OSC should play a role in monitoring the verification pilots to see if the discrimination is indeed reduced as predicted.

The Commission also reiterates its recommendation for a methodologically-sound study to document the nature and extent of unfair immigration-related employment practices that have occurred since the General Accounting Office's 1990 report. Only through such a study can it be determined whether employer sanctions-related discrimination has increased or decreased and how the pilot programs compare with the current situation on this indicator.

In 1996, IIRIRA changed the INA by requiring that an intent to discriminate must be proven for an employer to be found guilty of violating IRCA's antidiscrimination procedures with respect to document requests. Some believe that the intent standard will be a difficult one to prove and that it provides the employer with a loophole. The actual effect of this provision will be known only as OSC implements the statutory change and should be monitored.

Labor standards enforcement. Protecting authorized workers from employment abuses and substandard conditions and practices remains an essential ingredient of a strategy to combat illegal migration. Employers who hire illegal aliens tend to violate other labor standards and *vice versa.* Recently uncovered examples of exploitation of illegal aliens, including indentured servitude, highlight the necessity of enhanced labor standards enforcement. The Commission recommended in our 1994 report the allocation of increased staff and resources to the Department of Labor for the enforcement of wage and hour and other labor standards. We continue to believe that these additional resources are necessary, and the Commission continues to urge Congress to

authorize and fund additional labor standards investigators whose work should target industries hiring significant numbers of illegal aliens. As described more fully later in this report, we believe that the Department of Labor should have full capacity and authority to sanction employers who fail to verify work authorization as part of the agency's duties in enforcing labor standards.

- **Restricting eligibility of illegal aliens for publicly-funded services or assistance except those made available on an emergency basis or for similar compelling reasons to protect public health and safety or to conform to constitutional requirements.** Although public benefit programs do not appear to be a major magnet for illegal migrants, it is important that U.S. benefit eligibility policies send the same message as immigration policy: Illegal aliens should not be here and, therefore, should not receive public assistance except in unusual circumstances. The Commission recommended drawing a line between illegal aliens and lawfully-resident immigrants with regard to benefits eligibility, in part to reinforce this message. Immigrants are welcome in the country and, therefore, should be eligible for our basic safety nets; illegal aliens are not welcome and should not receive our assistance. We continue to believe that this demarcation between legal and illegal aliens makes sense. The Commission urges the Congress to reconsider the changes in welfare policy enacted in 1996 that blur the distinctions between legal and illegal aliens by treating them similarly for the purposes of many public benefit programs.

- **Strategies for addressing the causes of unlawful migration in source countries.** An effective strategy to curb unauthorized movements includes cooperative efforts with source countries to address the push factors that cause people to seek new lives in the United States. The Commission contin-

ues to urge the United States government to give priority in its foreign policy and international economic policy to long-term reduction in the causes of unauthorized migration. The United States can take many unilateral steps to improve its immigration policies, but U.S. policies alone will not stop unauthorized migration.

Recognizing the complex motivations behind unlawful movements, the Commission advocated the following possible interventions, many of which have indeed occurred. They include: arrangements to facilitate trade and investment in sending countries; support for human rights and democracy building; peacekeeping operations; humanitarian assistance in countries of origin and first asylum; deployment of human rights monitors; human rights training for government officials in potential sending countries; humane treatment of citizens and minorities; and reconstruction programs after civil wars and civil conflicts. In its 1997 report on refugee policy, the Commission recommended that the U.S. government continue demonstrating leadership in international responses to refugee and related humanitarian crises, including concerted diplomatic and other efforts to prevent the emergencies from occurring.

To focus greater attention on the causes of migration, the Commission recommends development of immigration impact analyses of foreign policy and trade decisions with potential migrant sending countries. The Commission also calls for adoption of focused strategies for communities producing large numbers of U.S.-bound migrants and strengthened intelligence gathering to improve early warning of large unauthorized movements. Other efforts to reduce the pressures of migration from the sending countries would be helpful, such as programs to arrest environmental damage

throughout the hemisphere, to restore the environment in such areas as Haiti and Mexico, to improve rural development and agricultural productivity, particularly in those areas where land is becoming marginalized and unlikely to sustain the local population without an intervention strategy, and to address other environmental problems such as clearing land mines in rural Central America.

Given its proximity to the United States and its number of migrants, the Commission believes increased coordination with Mexico is essential to address problems related to migration. The Commission notes with satisfaction the efforts being conducted jointly by the government of Mexico and the United States to improve coordination strategies and actions on their respective sides of the border and encourages the continuation of such important dialogues. In particular, the Commission recognizes the work of the Binational Study on Migration Between Mexico and the United States, the Working Group on Migration and Consular Affairs, the various cross-border liaison groups established along the border, and efforts between the two countries to coordinate antismuggling efforts, regulate the movements of people across land borders, deter third-country nationals transiting Mexico *en route* to the U.S., curtail auto theft and train cargo theft, reduce border violence, and enhance cross-border law enforcement cooperation.

The Commission also notes that action has taken place at the regional level; annual discussions have been convened involving the U.S., Mexico, and Central American countries. Further, the U.S. has held direct discussions with other countries in the region, such as Cuba, with whom it signed an agreement to curb unauthorized migration of its native population.

Despite that program, the need remains for forward looking consultative mechanisms between the U.S. and other countries. These should focus on exploring future policies and their migration implications as well as developing various policy scenarios and options for addressing unauthorized migration. Joint data collection and analysis also would be useful in resolving some of the disagreements surrounding migration, for example joint solutions to address the economic and social costs of the migration.

- **Mechanisms to respond in a timely, effective, and humane manner to migration emergencies.** A credible immigration policy requires the ability to respond effectively and humanely to migration emergencies in which large numbers of people seek entry into the United States. These emergencies generally include *bona fide* refugees, other individuals in need of protection, and persons seeking a better economic life in the U.S. Failure to act appropriately and in a timely manner to determine who should be admitted and who should be returned can have profound humanitarian consequences. Further, an uncontrolled emergency can overwhelm resources and create serious problems that far outlast the emergency.[16]

  Leadership. Past experiences demonstrate that leadership and a chain of command must be established quickly during an unfolding mass migration emergency to ensure an effective response. The proposed National Security Council focal point for refugee issues should assume these responsibilities because of the political nature of the decisions, the need for high Executive Branch access, and the need for credibility that derives from sufficient authority and government experience.

---

[16] For a fuller discussion of the Commission's recommendation on mass migration emergencies, see *U.S. Refugee Policy: Taking Leadership*, 1997.

Regional advance preparation. Mass migrations are likely to continue within this hemisphere. To respond effectively and humanely to future crises, the U.S. and its regional partners need a plan for a regional temporary protection system. This plan should identify sites, prepare protection guidelines and processing procedures at the primary protection sites and other locations, and create a funding proposal that clarifies financial responsibilities and accounts for marginal additional costs. It also should include measures to avert and resolve crises and develop plans for implementing durable solutions.

Domestic advance preparation. The U.S. must also finalize its own federal contingency planning for migration emergencies that has been under development during the past decade (with review and revision as needed). The presence of a such a contingency plan identifying various scenarios, policy responses, and appropriate steps for implementing them can help avoid both dangerous and costly *ad hoc* decisionmaking and disruption of normal operations. An effective and viable emergency response, however, requires that the agencies have sufficient resources and authorities to carry out their responsibilities. Thus, as part of this process, the U.S. must develop a realistic financing strategy and mechanisms to trigger allocation of funds.

Increased coordination among federal agencies involved in emergency responses—as well as with state and local agencies—also is necessary to ensure that the appropriate participants are identified and involved in the discussions and that as many decisions and responsibilities as possible are agreed upon prior to emergency situations. This would facilitate emergency responses by reducing the reluctance of state and local government to be involved, by clarifying lines of authority, and by increasing trust between the par-

ties. If they had the statutory authority to allow them to respond rapidly and efficiently, agencies with operational responsibility for mass migration emergencies could be more effective. This operational responsibility must include the authority to assign tasks to other agencies as needed.

Removals

A credible immigration system requires the effective and timely removal of aliens determined through constitutionally-sound procedures to have no right to remain in the United States. As the Commission stated in its 1994 Report, if unlawful aliens believe that they can remain indefinitely once they are within our national borders, there will be increased incentives to try to enter or remain illegally.

Our current removal system does not work. Hundreds of thousands of aliens with final removal orders remain in the U.S. The system's ineffectiveness results from a fragmented, uncoordinated approach, rather than flawed legal procedures. The Executive Branch does not have the capacity, resources, or strategy to detain aliens likely to abscond, to monitor the whereabouts of released aliens, or to remove them.

A large number of aliens—more than 250,000 in the past eight years—have been issued removal orders but have never been removed.[17] [See chart: Comparison of Removal Orders and Actual Removals.] In studying how the current system produces such a large number of unexecuted final removal orders, the Commission finds that the removal process is neither conceived of nor managed as an integrated system.

---

[17] Prior to IIRIRA, such orders were referred to as "deportation" and "exclusion" orders.

Comparison of Removal Orders and Actual Removals

YEAR	1989	1990	1991	1992	1993	1994	1995	1996	1997 (1st half)
ORDERS	48,000	52,000	60,000	65,000	70,000	84,000	105,000	131,000	64,000
REMOVALS	34,000	30,000	33,000	43,000	43,000	45,000	51,000	69,000	42,000
UNEXECUTED ORDERS	14,000	22,000	27,000	22,000	27,000	39,000	54,000	62,000	22,000
CRIMINAL REMOVALS	8,000	12,000	17,000	24,000	28,000	31,000	33,000	37,000	23,000
NONCRIMINAL ALIEN REMOVALS	26,000	18,000	16,000	19,000	15,000	14,000	18,000	32,000	19,000
INS DISTRICT IN SAN DIEGO REMOVALS	—	7,000	8,000	8,000	8,000	9,000	12,000	23,000	13,000

Sources: INS, EOIR, Administratively Final Removal Order by Month: Summary, July 24, 1997

The Commission urges immediate reforms to improve management of the removal system and to ensure that aliens with final orders of deportation, exclusion, or removal are indeed removed from the United States.

The Commission urges immediate reforms to improve management of the removal system and to ensure that aliens with final orders of deportation, exclusion, or removal are indeed removed from the United States.

In its 1994 report, the Commission recommended that the top enforcement priority should be the removal of criminal aliens from the U.S. in such a way that their potential return to the U.S. will be minimized. The INS has made considerable progress recently in removing larger numbers of criminal aliens. This year, INS is on track to remove 70 percent more criminal aliens than were removed in FY 1993. Despite these advances, the actual number of criminal alien removals still lags behind the total number who should be deported from this country.[18]

INS has been able to increase the number of criminal alien removals by detaining previously incarcerated aliens after they complete serving their sentences, through conclusion of their proceedings, and removal can be effected. More significantly, INS and the Executive Office for Immigration Review developed the Institutional Hearing Program [IHP] through which removal hearings are held in the prisons. When final orders are issued in this setting, criminal aliens can be deported directly from state or federal prisons, alleviating INS' need to detain them during deportation proceedings. The Commission recommended enhanced use of the IHP in its 1994 report. As the recent GAO testimony cited above indicates, improvements are still needed to ensure that INS identifies and deports all removable criminal aliens.

Further, while the INS has increased criminal alien removals over the last several years, noncriminal alien removals remained static

---

[18] See, e.g., GAO Testimony, "Criminal Aliens: INS' Efforts to Identify and Remove Imprisoned Aliens Need to Be Improved," before the Immigration and Claims Subcommittee, Committee on the Judiciary, House of Representatives, July 15, 1997.

until 1996, as the chart comparing removal orders and actual orders indicates. The recent increase in noncriminal removals may be somewhat related to increased detention space and resources authorized by Congress. However, much of the increase appears localized, suggesting that other forces are at work. As the chart further shows, removals from the San Diego District represent much of the increase and are related directly to the establishment of a Port Court in 1995.[19]

Even with these increased removals, the system needs significant improvements before it can be regarded as credible, that is able to deport most of the aliens with final orders of removal. To achieve this goal will require a new approach to correct a fundamental flaw—the fragmentation in the current conception and management of the removal system. Each part of the system—Investigations, Trial Attorneys, and Detention and Deportation—acts independently, impeding the total system's efficiency and leaving no one accountable for growing numbers of unexecuted final orders of removal.

The system starts with INS investigations of potential immigration law violations. When investigators find such violations, they issue notices placing aliens in removal proceedings. At that point, the investigators are finished with their assigned tasks; they are never connected to the results of their work—whether the alien was ultimately ordered removed and actually deported. Nor is their performance evaluated in connection with actual removals or with the priority that policymakers place on the removal of particular catego-

[19] When "Operation Gatekeeper" changed the patterns of how aliens attempted to enter the U.S. illegally and resulted in a significant increase in the number of aliens trying to cross with false documents at the port of entry, the U.S. Attorney worked with INS and EOIR to establish a more expeditious removal process for aliens apprehended at ports of entry. Previously, such aliens were simply turned back to Mexico; under the new system, they were placed in exclusion proceedings at the newly created Port Court. The aliens were detained for a few days, and the exclusion proceedings were expeditious because they were uncontested.

ries of aliens. Investigators do not, as a matter of practice, distinguish among priorities when initiating the formal removal process; both the worst violators and those who may have good claims for relief are placed in the same costly and time-consuming proceedings.

Once the proceedings have commenced, the INS Trial Attorney is responsible for the case. The volume of cases for each Trial Attorney is very large; yet, again there is no considered prioritization about which cases to proceed against and which not. Key policymakers do not provide guidance to Trial Attorneys about prioritizing cases, and, even if such guidance were provided, Trial Attorneys say that they are not given sufficient time to review cases to determine whether a case is worth pursuing. Again, there is no connection to the ultimate aim of the system—removing those who should be deported.

The system suffers further because many aliens are unrepresented and thus do not receive advice on whether to go forward because they have a chance of being granted relief. As the Commission learned in studying the results of the Florence Representation Project [see below], the removal process works much more efficiently when aliens receive advice of counsel. Those with weak cases generally do not pursue relief through proceedings if they understand from counsel that they will be wasting their time. As the late Chief Immigration Judge Robie pointed out, representation generally makes the court system work more efficiently. For example, Immigration Judges often grant continuances to unrepresented aliens to give them time to obtain counsel. In certain types of cases (particularly asylum claims), some judges are hesitant to proceed in the absence of representation. When a final order of removal is issued, another INS office, Detention and Deportation, takes responsibility for the case. This office is charged with managing detention space and effecting removal. The reality is that there will never be enough

space to detain everyone who should be removed. Nonetheless, no plan has been devised to pursue alternatives. The only experiment the INS has launched is the Vera Appearance Assistance Program that plans to test the utility of supervised release on various limited populations [as discussed below]. Unfortunately, due to internal INS problems, that pilot may not gain access to one of the main groups it should test—asylum seekers who meet the credible fear standard. No strategy has been devised for determining when, after the first hearing on the merits, detention is advisable because the likelihood of absconding is higher. Notices ordering removable aliens to report for deportation, known as "run" letters, continue to be issued at a 90+ percent no-show rate. No strategy has been developed for picking up aliens with final orders even when there is a recent address.

Establishing a more effective removal system requires changes in the management of the removal process. More specifically, the Commission recommends:

- **Establishing priorities and numerical targets for the removal of criminal *and* noncriminal aliens.** The Commission encourages headquarters, regional, and local immigration enforcement officials to set these priorities and numerical goals. Based on the above analysis of removal orders and actual removals, it appears that beyond the very highest removal priority—convicted criminals—targeted priorities of particular categories generally have not been developed at the national and local levels. Nor has INS developed numerical targets for the removal of specific categories of noncriminal aliens. This absence of prioritization and performance measures generally precludes serious consideration of what strategies, resources, and training will be needed to effect the desired removals.

Establishing removal of criminal aliens as a priority and setting numerical targets helped identify such new strategies as the IHP. The same process can work with regard to other categories of aliens, as can be seen in San Diego. Aliens who attempted to enter there with fraudulent documents were singled out as a priority for removal with an exclusion order. Formerly, those presenting fraudulent documents were permitted simply to withdraw their application for admission with no penalty. Setting the priority to remove aliens attempting reentry led to the decision to increase Inspection staff, establish a Port Court, identify additional detention space, and gain a commitment from the U.S. Attorney to prosecute those who attempted reentry after exclusion.

Failed asylum seekers [as the Commission recommended in our June 1997 Refugee Report], visa overstayers, unauthorized workers in targeted industries, and those who use false documents are categories that require attention if our removal system is to become credible and deter abuse. Setting priorities and numerical targets will help the government manage what is potentially a huge caseload of removable aliens.

- **Local oversight and accountability for the development and implementation of plans to coordinate apprehensions, detention, hearings, removal, and the prevention of reentry.** With guidance on priorities, local managers in charge of the removal system would be responsible for allocation of resources to ensure that aliens in the prioritized categories are placed in the process and ultimately removed. Local managers also would be responsible and accountable for identifying effective deterrents to reduce the likelihood that removed aliens would attempt to reenter the U.S. Managers need to redesign the system so that resources are balanced from beginning to end. Right now, the system is lopsided

and disconnected. The front end (Investigations) drives the system, and the back end (actual removals) is neglected. That imbalance can be corrected if the local offices develop plans to coordinate apprehensions, detention, hearings, and the removal process in ways that target the particular priorities in different districts. As discussed above, the San Diego district has had some success in focusing on aliens trying to enter with false documents. After identifying this priority, the U.S. Attorney coordinated the key federal government actors to ensure that these aliens were placed into proceedings, either returned to Mexico or detained for several days awaiting the hearing, promptly removed after the issuance of a final order, and prosecuted if they reentered.

As discussed above, the local INS Trial Attorneys, who are part of the General Counsel's Office, currently do not play a significant role in driving the removal system. The Commission believes Trial Attorney offices should function in the same manner that U.S. and District Attorney Offices do. Those offices determine which cases they will prosecute; and these determinations guide detectives as to which cases they bring to the U.S. or District Attorney for prosecution. Congress should provide sufficient resources to support such initiatives. Based on the policy guidance and plans developed by headquarters, regional and local offices, the chief Trial Attorneys [now called District Counsel] should make it clear to investigators which cases they will pursue in proceedings and which cases they will not. Investigators should then target these priority cases. Local heads of Immigration Enforcement Offices should be held accountable for the planning and implementation of this reconceived removal system. To ensure such accountability, these local officials should have authority over both the prosecutorial and police functions.

- **Continued attention to improved means for identifying and removing criminal aliens with a final order of deportation.** The Commission reiterates the importance of removing criminal aliens as a top priority. Our recommendation regarding the importance of removing noncriminal aliens with final orders is not intended to shift the attention of the removal system away from this priority. Rather, both criminal and noncriminal aliens must be removed to protect public safety (in the case of criminals) and to send a deterrent message to *all* who have no permission to be here.

  To improve the effectiveness of the criminal removal system, criminal aliens must be identified as early in the process as possible. The local jail pilot project mandated by § 329 of IIRIRA should be used to help determine how early in the criminal process identification should occur. The Department of Justice and the state and local criminal justice agencies should develop uniform means of identification, and the data systems of these agencies should be linked to identify more effectively criminal aliens who should be removed.

  With respect to the Institutional Hearing Program, the GAO found that the INS (1) failed to identify many removable criminal aliens and initiate IHP proceedings for them before they were released from prison, and (2) did not complete the IHP by the time of prison release for the majority of criminal aliens it did identify. GAO recommended improved data systems to track the IHP status of each foreign-born inmate and the development of a workload analysis model to identify the IHP resources needed in any period to achieve overall program goals. The Commission believes that the development of uniform means of such identification and linked data also will help the program achieve its goals.

The Commission urges the Department of Justice to attend carefully to actual removals in two additional ways. First, we have heard serious complaints from foreign authorities that they are not being notified that the U.S. is returning a criminal alien. DOJ must develop an improved notification process so that appropriate authorities in the countries to which criminal aliens are being returned can plan for such returns and take these individuals into custody if necessary. Second, we also have learned that many criminal aliens are being returned unescorted. For public safety reasons, criminal aliens should be returned by escort.

- **Legal rights and representation.** The Executive Branch should be authorized to develop, provide, and fund programs and services to educate aliens about their legal rights and immigration proceedings. Such programs also should encourage and facilitate legal representation where to do so would be beneficial to the system and the administration of justice. Particular attention should be focused on aliens in detention where release or removal can be expedited through such representation. The alien would not have a right to appointed counsel, but the government could fund services to address some of the barriers to representation.

  Under the provisions of § 292 of the Immigration and Nationality Act, an alien placed in proceedings is guaranteed the privilege of being represented by an attorney or other qualified legal representative, but at no expense to the government. Under this system, the alien is provided with a list of local attorneys and accredited organizations practicing immigration law who might be able to provide legal representation. Studies have shown that the vast majority of aliens in proceedings before Immigration Judges are not represented by counsel. This is accounted for by several

factors including the lack of English proficiency on the part of aliens, a lack of understanding of the legal process and of their legal rights, the lack of funds to hire an attorney, and an inability to find someone available and willing to represent them. Securing the services of an attorney or otherwise qualified legal representative presents a particular challenge for detained aliens whose freedom is constrained, who have limited phone privileges, and who find themselves situated in locales not readily served by or accessible to the legal community.

Experience demonstrates that when aliens are represented in proceedings, cases move more efficiently, economically, and expeditiously through the system. Indeed, represented aliens with little or no chance of prevailing can be more readily weeded out of the system. Aliens who have legal representation are much more likely to appear at their hearings than unrepresented aliens. Fewer continuances are needed or granted in the case of represented aliens. Hearings take less time. Issues presented for decision by the immigration courts and on appeal are more readily narrowed. Applications for relief are better prepared and presented in immigration court. Appeals are more cogently presented and are supported by legal briefs. Simply put, when aliens in proceedings or on appeal have legal representation, the system works better.

The Commission visited the Florence Immigration and Refugee Rights Project in Florence, Arizona, a project that demonstrates the advantages of programs designed to educate aliens about their rights and that provides a triage system to secure representation for those with a likely avenue for relief. The Project screens detainees for eligibility for immigration benefits and relief from deportation, exclusion, or removal, informs aliens about their rights, and directly rep-

resents as many as it can handle, with the overflow referred out to *pro bono* attorneys. The Project has been recognized for its success and assistance in moving cases through the system while affording due process. An evaluation of the Project found that aliens with representation had a better opportunity to become aware of their rights and legal options. Many inside and out of government believe that the Florence Project reduces alien detention time, expedites removal by decreasing necessary immigration court time, and increases court efficiency. Representation also decreases anxiety and behavioral problems among detainees.

The Commission believes that programs like the Florence Project should be facilitated and encouraged. Moreover, the Commission believes that the Executive Branch should be granted the authority to develop, provide, and fund other programs and services that inform aliens about their rights and the proceedings in which they are placed and to otherwise facilitate legal representation where to do so is a benefit to the system. Under this approach, the alien would not have a right to appointed counsel, but the government could fund ancillary services, such as rights presentations, interpreters, transportation, attorney/client meeting places, and training to address some of the barriers to increased legal representation.

- **Prosecutorial discretion to determine whether to proceed with cases.** Guidelines on the use of prosecutorial discretion should be developed; local Trial Attorneys should be trained to exercise discretion and support staff should be provided to ensure that Trial Attorneys have the time needed to screen cases prior to hearings. Discretion should be exercised with the goal of establishing a more efficient and rational hearing system.

In addition to targeting priority cases, the District and U.S. Attorneys decide which of those cases to prosecute based on an assessment of the strength of each case. In contrast, by and large, the INS prosecutes all cases that appear to involve violations of law. The Commission is concerned about the cost of litigating every case, both in terms of the credibility of the system and expenditure of public funds. We have recommended setting priorities as a strategy to establish credibility and to send a deterrent message. Here we urge the development of a system based on a sensible goal: prosecution of those who actually will be removed.

To establish a removal system that operates efficiently by prosecuting appropriate cases and settling those, for example, where relief is likely to be established, guidelines should be developed and issued by the General Counsel. Trial Attorneys should be trained to create and apply these guidelines nationwide. Finally, Trial Attorneys need time to screen cases prior to a removal hearing and to determine whether the alien has a strong claim for relief. To free up their time, support staff should be provided to handle the clerical work that currently burdens the Trial Attorneys. By wisely applying their discretion, the Trial Attorneys could then focus their attention on immigration court cases that are likely to result in the removal of the alien upon completion of the proceedings. This "out-of-court" approach also would assist the Immigration Judges and the private immigration bar by reducing the amount of time all parties spend in immigration court.

- **Strategic use of detention and release decisions.** Detention space, always in limited supply, is in greater demand as the government has focused more on the removal of criminal aliens and as Congress mandates more categories to be detained. IIRIRA requires the Attorney General to detain all

aliens found inadmissible or deportable on criminal or terrorist grounds. The criminal grounds include convictions for certain crimes now categorized as "aggravated felonies" for which a sentence of one year imprisonment or more may be imposed. Congress enacted these changes knowing that current detention space and personnel were insufficient to execute such expanded detention requirements and allowed the Attorney General to waive these requirements for two one-year periods while developing the capacity to handle these developments. The Attorney General notified the Judiciary Committees of the insufficiencies for the first year. IIRIRA also requires the detention of asylum seekers during the credible fear determination process.

Detention needs to be used more strategically if the government is going to target and remove designated categories of aliens determined to be priorities in particular locales. If it appears that asylum abuse is getting out of hand in one locality, for example, detention space would be needed to ensure that failed asylum seekers are removed.

Alternatives to detention should be developed so that detention space is used efficiently and effectively. In 1997, INS initiated a three-year pilot program, created with and implemented by the Vera Institute of Justice, that may help define effective alternatives to detention for specific populations. The Vera Assistance Appearance Program aims to develop and validate with formal research a supervision program that will increase both appearances at immigration court proceedings and compliance with the legal process among those not detained, while ensuring efficient use of detention space. The program thus aims to address important removal problems: The Executive Branch can detain only a fraction of individuals in removal proceedings; those who are not detained often do not appear in court and rarely

comply with removal orders. The pilot will free up valuable detention space by keeping out of detention aliens who may eventually be granted relief. If the Vera pilot demonstrates the utility of supervised release, an assessment of chances for relief and community ties or supervision would assist the Department of Justice in determining more precisely when detention is needed in each case to ensure that aliens who ultimately receive no relief do not abscond. It is hoped that the pilot will provide insight into the use of reporting mechanisms as well as the role of community organizations who take responsibility for maintaining contact with and reminding those released of their responsibilities to the immigration court.

The Commission considers the Vera pilot of great importance to the development of an effective removal system. INS officials at headquarters and in the local offices should work together to see that this pilot serves as a valid test of detention alternatives. In particular, the pilot should be permitted access to those asylum seekers who meet the "credible fear" test for two reasons. First, detaining individuals who have met an initial threshold demonstrating their likelihood of obtaining asylum is not a good use of scarce detention resources. As the Commission stated in its Refugee Report, "credible fear" is an appropriate standard for determining who will be released from detention; it is not appropriate for determining who will gain access to an asylum hearing, except under exceptional circumstances. Second, asylum seekers who have met the credible fear test will enable the pilot to test the utility of supervised release and make recommendations on the role of community ties and sponsors.

Additional alternatives should be developed to address local situations. For example, in border communities, aliens with pending cases could be permitted to return to Mexico and come to Port Court for their hearing in lieu of detention, as occurs in San Diego. The aliens in such proceedings are told the consequence of their failure to appear—that they will be found excludable in absentia and criminally prosecuted if they attempt to reenter.

- **Improved detention conditions and monitoring.** Over the past two decades, INS has taken on significant responsibilities in detaining aliens. INS detains a broad range of aliens of both genders, from criminals to asylum seekers. While short detention periods typically are contemplated for those awaiting removal hearings, the results often are otherwise. The INS has also become the long-term jailer for a significant number of removable aliens from Cuba, Vietnam, and other nations. INS currently operates nine Service Processing Centers and, like the U.S. Marshals, contracts bed space with many state and local jails. In recent years, Congress has increased significantly resources for detention space: total available beds per day totaled 8,600 in 1996; INS is close to reaching its goal of 12,000 by October 1997.

  Serious problems have occurred, the most prominent in 1995 when the ESMOR Contract Facility in Elizabeth, New Jersey, was shut down following an incident in which detainees voiced complaints of physical abuse, stealing, and harassment by guards. INS' own investigation of the facility uncovered serious management problems. More regularly, complaints regarding local jails have included human rights abuses, overcrowding, poor nourishment, mixing of women

and juveniles with men and of asylum seekers with criminals, and lack of access to health care, counsel, family, and recreation.

Detention cannot be used effectively unless and until the conditions of detention are humane and detainees are free from physical abuse and harassment by guards. We have no doubt that appropriate criteria for all facilities can be promulgated, based on sound governmental judgment and consultation with concerned nongovernmental organizations. But most importantly, a system to monitor facilities and publish findings on a regular basis must be developed. Inspections must occur more than once annually.

Further, the Commission recommends that the Department of Justice consider placing administrative responsibility for operating detention centers with the Bureau of Prisons or U.S. Marshals Service. An immigration enforcement agency should not be shouldered with such a significant responsibility that is not part of its mission or expertise.

- **Improved data systems.** The Commission recommends that data systems link apprehensions and removals. Current data systems are unable to link an apprehension to its final disposition (e.g., removal, adjustment of status). In addition, INS statistics relate to events, not individuals. This significantly limits the use of apprehension and removal data for analytical purposes. The Commission urges development of data systems that link apprehensions and removals and provide statistics on individuals. This would foster a better understanding of apprehension as a removal tool and provide better information on recidivism.

- **The redesigned removal system should be managed initially by a Last-In-First-Out [LIFO] strategy to demonstrate**

the credibility of the system. Once a coherent system is organized and appropriate resources are assigned to removing deportable aliens—not simply to put aliens through proceedings—removals should proceed in a Last-In-First-Out mode. In this way, the government can send a credible deterrent message to failed asylum seekers, visa overstayers, users of counterfeit documents, and unauthorized workers, that their presence in the United States will not be tolerated. The LIFO model has worked successfully in the affirmative asylum system, allowing the government to demonstrate control over the current caseload and to quickly establish priorities for dealing with the backlog for enforcement purposes. It can provide both the measure of success for the removal system as well as convey the proper deterrent message.

The Commission urges Congress to clarify that the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 and the Antiterrorism and Effective Death Penalty Act of 1996 do not apply retroactively to cases pending when the new policies and procedures went into effect. As a matter of policy, the Commission believes that retroactive application of new immigration laws undermines the effectiveness and credibility of the immigration system. Applying newly-enacted laws or rules in an immigration proceeding that is pending results in inefficiency in the administration of the immigration laws. It also can raise troubling issues of fairness.

The Commission urges Congress to clarify that IIRIRA and AEDPA do not apply retroactively to cases pending when the new policies and procedures went into effect.

There is no uniform effective date for the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 in its entirety. Instead, and to the extent it has spoken on the matter, Congress has imposed several different effective dates depending on the provisions involved. Most of the new removal provisions became effective on April 1, 1997. The fact that a statutory provision takes effect upon enactment or upon a future date certain, does not re-

solve the issue of whether the provision applies to cases already pending. When new statutory provisions are applied to such categories of cases, it is generically considered a "retroactive" application of the law.[20]

Although retroactive application of new statutory requirements by Congress is legally permissible (subject to certain constitutional constraints), it does not constitute sound public policy. Ours is a system governed by the rule of law. In our view, retroactively changing the applicable rules once a legal proceeding has commenced not only is manifestly unfair, but also invites confusion, adds uncertainty, and fosters a lack of trust and confidence in the rule of law.

We are concerned as well that retroactively applying new statutory provisions results in inefficiency and simply does not make good sense given the current realities of administering the immigration laws. As fully discussed earlier in this report, hundreds of thousands of outstanding administratively final orders of deportation remained unexecuted long before the enactment of either IIRIRA or

---

[20] The analytical model for determining statutory retroactivity, set forth by the Supreme Court of the United States in *Langraf v. U.S.I. Film Products, Inc.*, 511 U.S. 244 (1994), is aptly encapsulated in the following excerpt from *Immigration Law and Procedure*, Gordon and Mailman, Chapter 61, Special Alert, SPA61-1, 2 (1997):

> [T]he first step is to determine whether Congress expressly defined the statute's proper reach. The language of the statute must be examined to determine whether it manifests an intent to apply to cases or conduct that arose before the law's enactment. For the statute to apply retroactively, there must be an "unambiguous directive" or an "express command" from Congress that it intended such application. In the absence of such an unambiguous directive, it must be determined whether the new statute "attaches new legal consequences to events completed before its enactment" or "would impair rights a party possessed when he acted, increase a party's liability for past conduct or impose new duties with respect to transactions already completed." If the statute has this effect, it should not apply retroactively.

AEDPA. Clearly, the system has had little problem in establishing sufficient grounds for deportation and exclusion under prior law. Moreover, although relief from deportation and exclusion under prior law was available, the number of granted applications was proportionally very small compared to the number of aliens in proceedings. The problem, then, has not been in ordering the deportation or exclusion of immigration violators, or in granting relief in a relatively small percentage of cases. The problem has been in actually removing aliens who have been found to be deportable, excludable, or removable following the conclusion of their proceedings.

As noted above, the system is not yet removing anything approaching 100 percent of the existing detained or nondetained criminal alien population for whom an administratively final order of deportation or exclusion already has been entered or who are otherwise deportable or excludable under prior law based on their criminal conduct. Moreover, the system has failed to remove significant numbers of noncriminal aliens against whom orders of deportation or exclusion have been outstanding for several years. Although retroactive application of the 1996 legislation will both significantly increase the numbers of removable aliens and decrease the numbers of aliens who might have otherwise qualified for existing relief, the system does not have the capacity actually to remove these added numbers of individuals. The resulting situation serves only to further erode the effectiveness and credibility of the immigration system as a whole.

ACHIEVING IMMIGRATION POLICY GOALS

INTRODUCTION

Restoring credibility and setting priorities—themes at the center of the Commission's policy recommendations on illegal and legal immigration, respectively—will not come to pass unless the government is structured to deliver on these policies. An effective immigration system requires both credible policy and sound management. Good management cannot overcome bad policy. Poor structures, lack of professionalism, poor planning, and failure to set priorities will foil even the best policies.

Until relatively recently, the agencies responsible for implementing immigration policy were underfunded, understaffed, and neglected. During the past few years, however, massive increases in resources and personnel, combined with significant political attention to immigration issues, have provided new opportunities to address long-standing problems. A recent General Accounting Office report documented improvements—including, for example, a more strategic approach to the formulation of immigration enforcement programs—but concluded that management problems remain. Further change is required if the overall U.S. immigration system is to function smoothly and effectively, anticipating and addressing, rather than reacting to, problems.

STRUCTURAL REFORM

The Commission recommends fundamental restructuring of responsibilities within the federal government to support more effective management of the core functions of the immigration system: border and interior enforcement;

The Commission recommends fundamental restructuring of responsibilities within the federal government to support more effective management of the core functions of the immigration system: border and interior enforcement, enforcement of immigration-related employment standards, adjudication of immigration and naturalization applications, and appeals of administrative decisions.

*enforcement of immigration-related employment standards; adjudication of immigration and naturalization applications; and appeals of administrative decisions***.** The immigration system is one of the most complicated in the federal government bureaucracy. In some cases, one agency has multiple, and sometimes conflicting, operational responsibilities. In other cases, multiple agencies have responsibility for elements of the same functions. Both situations create problems.

Mission overload. Some of the agencies that implement the immigration laws have so many responsibilities that they have proved unable to manage all of them effectively. Between congressional mandates and administrative determinations, these agencies must give equal weight to more priorities than any one agency can handle. Such a system is set up for failure, and, with such failure, further loss of public confidence in the immigration system.

No one agency is likely to have the capacity to accomplish all of the goals of immigration policy equally well. Immigration law enforcement requires staffing, training, resources, and a work culture that differs from what is required for effective adjudication of benefits or labor standards regulation of U.S. businesses. While some argue that enforcement and benefits are complementary functions, we agree with the Commission for the Study of International Migration and Cooperative Economic Development [Asencio Commission, after its Chair] that placing incompatible service and enforcement functions within one agency creates problems: competition for resources; lack of coordination and cooperation; and personnel practices that both encourage transfer between enforcement and service positions and create confusion regarding mission and responsibilities. Combining responsibility for enforcement and benefits also blurs the distinction between illegal migration and legal admissions. As a matter of public policy, it is important to maintain a bright line between these two forms of entry. We believe the Asencio Commission was correct in contending that separating enforcement and benefits functions

will lead to cost efficiencies, more effective enforcement, and improved service to the public.

Diffusion of responsibilities among agencies. Responsibility for many immigration functions are spread across numerous agencies within single departments or between departments. This fragmentation of responsibility is most clear in relationship to the adjudication of applications for admission as a legal permanent resident: responsibility for making decisions on skill-based immigrant and LDA applications is dispersed among the Department of Labor, the Department of Justice's Immigration and Naturalization Service and the Department of State. Responsibility for investigating employer compliance with immigration-related labor standards is shared by INS and DOL. Additionally, the United States Information Agency has responsibility for determining who will enter with a J visa, under which some exchange visitors work in this country. USIA also must sign off on requests for waivers of the two-year home residency required of some J visa holders before they can adjust their status to other nonimmigrant or immigrant categories.

A second area in which responsibility is diffused and activities are redundant is worksite enforcement. Both INS and DOL conduct investigations to determine if employers have violated the employment eligibility verification requirement. Sanctions may be imposed by INS against employers who knowingly hire unauthorized workers. The DOJ Office of Special Counsel has related responsibilities in determining if employers are engaging in immigration-related unfair employment practices.

Fragmentation of responsibility leads to conflicting messages from the various agencies, unnecessary delays in adjudication, and, when more than one agency must adjudicate the same request, redundancies in actual implementation.

Current U.S. Immigration System

AGENCY \ FUNCTION	IMMIGRATION ENFORCEMENT	IMMIGRATION BENEFITS	LABOR STANDARDS	APPEALS
DEPARTMENT OF JUSTICE				
Immigration & Naturalization Service	✓	✓	✓	✓
Executive Office for Immigration Review				✓
DEPARTMENT OF STATE

Employment Training Administration		✓		
Board of Alien Labor Certification Appeals				✓

*For a limited set of nationality- and citizenship-related matters.

The Commission considered a range of ways to reorganize roles and responsibilities, including proposals to establish a Cabinet-level Department of Immigration Affairs or an independent agency along the lines of the Environmental Protection Agency. We believe a new department or independent agency is neither practical nor desirable, particularly in the context of current interest in streamlining government operations, not creating sizeable, new entities.

After examining the full range of options, the Commission con-

Proposed
U.S. Immigration System

AGENCY \ FUNCTION	IMMIGRATION ENFORCEMENT	IMMIGRATION BENEFITS	LABOR STANDARDS	APPEALS
DEPARTMENT OF JUSTICE Bureau for Immigration Enforcement	✓			
DEPARTMENT OF STATE Undersecretary for Citizenship, Immigration, and Refugee Admissions		✓		
DEPARTMENT OF LABOR Employment Standards Administration			✓	
AGENCY FOR IMMIGRATION REVIEW				✓

cludes that a clear division of responsibility among existing federal agencies, with appropriate consolidation of functions, will improve management of the federal immigration system. As discussed below, *the Commission recommends a restructuring of the immigration's four principal operations as follows:*[1]

1. ***Immigration enforcement at the border and in the interior of the U.S in a new Bureau for Immigration Enforcement at the Department of Justice;***

2. ***Adjudication of eligibility for immigration-related applications (immigrant, limited duration admission, asylum, refugee, and naturalization) in the Department of State under the jurisdiction of a new Undersecretary for Citizenship, Immigration, and Refugee Admissions;***

The Commission recommends a restructuring of the immigration system: 1. Immigration enforcement at the border and in the interior of the U.S at the Department of Justice; 2. Adjudication of eligibility for immigration-related applications in the Department of State; 3. Enforcement of immigration-related employment standards in the Department of Labor; and 4. Appeals of administrative decisions in an independent review agency.

Proposed Restructuring of the Immigration System

DEPARTMENT OF JUSTICE	DEPARTMENT OF STATE	DEPARTMENT OF LABOR	INDEPEN DENT AGENCY
BUREAU FOR IMMIGRATION ENFORCEMENT	UNDERSECRETARY FOR CITIZENSHIP, IMMIGRATION, AND REFUGEE ADMISSIONS	EMPLOYMENT STANDARDS ADMINISTRATION	AGENCY FOR IMMIGRATION REVIEW
Immigration enforcement at the border and in the interior of the United States	Adjudication of eligibility for immigration-related applications	Enforcement of immigration-related employment standards	Administrative review of all authorized immigration-related appeals

3. ***Enforcement of immigration-related employment standards in the Department of Labor; and***

4. ***Appeals of administrative decisions, including exclusion, deportation, and removal hearings, in an independent agency, the Agency for Immigration Review.***

The Commission believes this streamlining and reconfiguring of responsibilities will help ensure: coherence and consistency in immigration-related law enforcement; a supportive environment for adjudication of applications for immigration, refugee, and citizenship services; rigorous enforcement of immigration-related labor standards to protect U.S. workers; and fair and impartial review of immigration decisions.

Bureau for Immigration Enforcement (DOJ)

The Commission recommends placing all responsibility for enforcing United States immigration laws to deter future illegal entry and ***remove illegal aliens in a Bureau for Immigration Enforcement in the Department of Justice.*** The Commission believes that the importance and complexity of the enforcement function within the U.S. immigration system necessitate the establishment of a higher-level, single-focus agency within the DOJ. The Commission further recommends that the newly configured agency have the prominence and visibility that the Federal Bureau of Investigation [FBI] currently enjoys within the DOJ structure. The Director of the Bureau for Immigration Enforcement would be appointed for a set term (e.g., five years). The agency would be responsible for planning, implementing, managing and evaluating all U.S. immigration enforcement activities both within the United States and overseas.

The Commission recommends placing all responsibility for enforcing United States immigration laws to deter future illegal entry and remove illegal aliens in a Bureau for Immigration Enforcement in the Department of Justice.

[1] See Appendix for Commissioner Leiden's concurring statement.

The new agency's responsibilities would include many functions currently performed by the INS: inspections and admissions at air, land, and sea ports of entry and at pre-inspection facilities overseas; border management and control between ports of entry; apprehension and prosecution and removal of illegal residents and workers; oversight of pre- and post-trial/hearing release; identification and prosecution of document fraud; identification, deterrence, and prosecution of alien smuggling gangs; and other domestic and overseas deterrence activities.

The Commission believes that the current U.S. immigration system structure diffuses and confuses potential for a more concerted focus on central functions and activities. Enforcement objectives sometimes conflict with service goals and *vice versa*. Often, both compete for limited operational resources and for the time and attention of those responsible for planning, administering, and managing these programs.

The Commission is particularly concerned that although the current removal system produces more than 100,000 final removal orders each year, the system does not have the corresponding capability to remove the individuals subject to those orders. The Commission believes that it is critical to the credibility of the removal sector of the enforcement system that the agency be held accountable for setting realistic numerical priorities and producing specific outcomes. Upper-level management must be responsible for effecting an integrated system such that the agency apprehends, detains, and proceeds against those aliens it prioritizes for removal, and ultimately removes all those being issued final orders of removal.

To establish such an integrated system, the Commission recommends that the new enforcement agency have a more traditional law enforcement model structure and that it focus on police activities, pre- and post-trial probation services, and prosecution. Agency person-

nel should be upgraded to receive pay and benefits commensurate with those provided to other Department of Justice law enforcement agents. At present INS personnel performing the same functions as FBI or Drug Enforcement Agency [DEA] personnel are often at a lower-pay grade.

The police function would be carried out by *uniformed services,* such as Inspectors and Border Patrol Agents, and *investigators* who would conduct investigations and collect intelligence at the border and in the interior to deter smuggling, facilitate removals, and accomplish other similar goals. The Commission suggests turning over most detention responsibility to the U.S. Marshals Service and/or the Bureau of Prisons.

As in other law enforcement operations, particularly those in which more people are put into proceedings than can either be accommodated in detention or actually removed, there is a need for *pre- and post-trial/hearing screening* and/or *supervised release* on probation or bond. In the immigration context, these could be available, for example, to asylum-seekers who are deemed by an Asylum Officer to have demonstrated a credible fear of persecution, to those who have accepted voluntary departure and posted bond, or to those unlikely (because of close family members or other strong community ties) to abscond pending completion of their hearings or sentences.

To ensure a high expectation of individuals actually being removed from the U.S. within a certain time, the Commission believes that Trial Attorneys should have greater discretion to set priorities for apprehension and prosecution and to determine which cases are pursued for removal proceedings.

The Commission recommends the following distribution of responsibilities within the Bureau for Immigration Enforcement.

Uniformed enforcement officers. The Commission recommends merger of the INS Inspectors, Border Patrol, and detention officers into one unit, the Immigration Uniformed Service Branch. Its officers would be trained for duties at land, sea, and air ports of entry, between land ports on the border, and in the interior where uniformed officers are needed for enforcement. The unit would be accountable for both the facilitation of legal traffic at the ports of entry and the enforcement against illegal entry. It also would be responsible for moving detainees from apprehension sites to detention facilities and to hearing sites, as well as for escort duty during removals. After appropriate training, most of the officers performing these various functions could be transferred interchangeably, and opportunity for job mobility would exist across lines not now possible. As stated above, grade level and pay should be upgraded as needed to be commensurate with the law enforcement activities the officers will perform.

Unlike the current practice in which the Border Patrol reports to Sector Chiefs and Inspectors report to District Directors, all uniformed officers within a particular geographic area would be under the authority of a single, integrated immigration enforcement manager.

Investigators. The Commission believes investigations will be a key part of the new agency's responsibility. Investigators are the main agents responsible for identifying and apprehending people who are illegally residing or working in the United States, for deterring smuggling operations, for building a case against those who are not deterred, and for identifying, apprehending, and carrying out the removal of aliens with final orders of removal.

Only some 2,900 employees, out of an INS staff of more than 25,000, work on these many investigative tasks. A similar number work in INS Detention and Deportation. Most of these Deportation Officers

could—given additional on-the-job training and supervision conduct investigations. Deportation Officers now deal almost exclusively with docket control and management paperwork that could be done by lower level support staff, freeing the Deportation Officers for field work.

INS Investigators primarily work the front end of the removals process: identifying and arresting those who are illegally residing or working in the U.S. Little attention is given to the removal process as a whole, for ensuring availability of adequate detention space, allocating ample Trial Attorney and Immigration Judge time, effecting transfer to airports, and achieving physical removal. The system is bogged down with increasing numbers of aliens who are apprehended, charged with an immigration violation, put into proceedings, released due to lack of detention space or other prerequisites for effective timely processing, never appear at their hearings, or are never deported after a final order of removal is issued. The failure of careful planning and integration of the process means many of those who are apprehended are never removed. According to some observers, the INS' compartmentalized program planning, budgeting, and implementation procedures blunt attempts to integrate these functions more fully into a seamless and effective process.

"Removal Officers" in the new Bureau for Immigration Enforcement, who would integrate the functions of Investigators and Deportation Officers in apprehensions and removals, would enable the immigration system to deliver better on its commitment to actually remove those who are issued final orders. Managers would then have the flexibility to shift resources among various investigations activities as needed to produce a smooth-flowing process that ensures timely removal. As dsicussed above, grade and pay should be commensurate with the often dangerous law enforcement duties performed by investigators.

Intelligence. The Bureau for Immigration Enforcement will require an Intelligence Division to provide strategic assessments, training and expertise on fraud, information about smuggling networks, and tactical support to uniformed officers or investigators. It would act as a liaison with other federal law enforcement agencies and share information and intelligence. The Intelligence division would be one of the smallest in the agency with an anticipated staff of about 100 employees.

Assets Forfeiture Unit. As with the other DOJ enforcement agencies, the Bureau would have an Assets Forfeiture Unit. Statutory authority for Assets Forfeiture activities is a useful addition to the range of strategies and sanctions available to the U.S. law enforcement community. Augmented authorities in the 1996 immigration legislation increased both its usefulness and the potential for misuse or abuse. In order to be aggressive in using these new authorities and equally aggressive and proactive in ensuring against misuse/abuse, DOJ agencies established assets forfeiture units under the general guidance of the DOJ Assets Forfeiture Unit. Each agency, including FBI, DEA, and INS, has its own unit. These units, usually highly-placed within the agency, are the focal points for agency-wide asset-related policy implementation, field staff training, and field operations monitoring. They assist the agency's field staff in case development, monitor use of assets forfeiture funds, and oversee use of these sanctions to guard against abuse.

Pre- and post-trial "Probation" Officers. "Probation" functions are not now performed consistently or effectively in the immigration system, but the Commission believes these functions are essential to more strategic use of detention space. District Directors and Immigration Judges determine the release (either on personal recognizance or on bond) of apprehended aliens from detention. Often, release relates more to lack of detention space than to the likelihood that aliens will appear at their proceedings or assessment of aliens' danger to the community. Some aliens are given the option to

depart voluntarily, but there is little tracking of whether they actually leave the country. As it is unlikely that all potentially deportable aliens could or should be detained awaiting removal, the Commission believes more attention should be given to supervised release programs and to sophisticated methods for tracking the whereabouts of those not detained.

Pilot programs, such as the Vera Institute Appearance Assistance Program discussed above, could be expanded into more areas if successful. INS requested this three-year project in the New York area. It studies reporting requirements and the effectiveness of community sponsors in supervising the release of aliens who meet certain criteria regarding community ties, relief from removal, and public safety. The program aims to free up valuable detention space for aliens without legal remedies who are likely to abscond, while keeping those who might receive relief out of detention.

Trial Attorneys/Prosecutors. INS has nearly 800 staff involved in immigration-related legal proceedings, such as offering legalopinions and advice and representing the government's interests in proceedings before Immigration Judges and on appeal.

The Commission believes that the Trial Attorneys, who, in effect, are the Government's immigration prosecutors, should be vested with, *and should utilize*, an important tool possessed by their criminal counterparts: prosecutorial discretion. Under the current system, the Trial Attorneys do not as a practice use discretion in determining which cases to pursue. The INS does not sufficiently prioritize or target cases; instead it acts as if it had the means to prosecute each and every case effectively. Cases go forward, even when an alien will, or is likely to, prevail on an application for relief or when there is no realistic belief that the alien will ever be removed from the country. Discretion exercised at the beginning of the process and at every step would target the use of scarce resources better and contribute to a more effective and credible system. Central office lead-

ership would be required to set appropriate priorities and provide guidance to the Trial Attorneys as to the proper use of discretion.

Greater sharing of information between the Trial Attorneys, aliens, and their counsels would facilitate smoother and more expeditious movement through the system and fewer Freedom of Information Act requests. Greater use of stipulations and pretrial conferences (with sanctions resulting when attorneys are not prepared), would narrow the disputed issues needing court resolution and time.

Field Offices. The new enforcement agency would implement its programs through a series of field offices structured to address comprehensively the immigration enforcement challenges of the particular locality As the location of these offices should be driven by enforcement priorities, they would likely be located in different places than current district offices. Regional Offices could be retained for administrative and managerial oversight of these dispersed and diverse field offices. The field office inspections officers at ports of entry would both facilitate the admission of legal limited duration admissions and immigrants and the identification of illegal entrants. Border Patrol stations along the border and at checkpoints along major interior transportation corridors would facilitate enforcement activities. Appropriate field offices also would investigate and prosecute cases and contribute to detection and destruction of smuggling rings.

Current INS Regional Offices could be retained for administrative and managerial oversight of these dispersed and diverse field offices. Most existing district offices and suboffices could be incorporated into the new agency; they also could supervise and administer the Border Patrol. [Until the mid-1950s, Border Patrol units worked out of and reported to INS District Offices.] The INS overseas enforcement presence could be retained and expanded by the new enforcement agency.

Citizenship, Immigration, and Refugee Admissions (DOS)

The Commission recommends that all citizenship and immigration benefits adjudications be consolidated in the Department of State, and that an Undersecretary for Citizenship, Immigration, and Refugee Admissions be created to manage these activities. At present, three separate agencies—the INS, the Department of State, and the Department of Labor—play broad roles adjudicating applications for legal immigration, limited duration admission, refugee admission, asylum, and/or citizenship. In addition, the Department of Health and Human Services plays an ancillary role in setting requirements regarding health standards for new arrivals, and the United States Information Agency has a major role in exchange visitor programs.

The Commission recommends that all citizenship and immigration benefits adjudications be consolidated in the Department of State, and that an Undersecretary for Citizenship, Immigration, and Refugee Admissions be created to manage *these activities.*

The Commission believes a more streamlined and accountable adjudication process, involving fewer agencies but greater safeguards, would result in faster and better determinations of these benefits. Consolidation of responsibility in one department would permit a reengineering of the adjudication process to make it more efficient and timely.

In considering which department should be responsible for adjudicating citizenship and immigration benefits, the Commission considered each agency's current role and overall mission. Immigration has been a stepchild in each of the major departments with current responsibilities. The Department of State's primary role is the conduct of foreign relations, and immigration issues have been subsumed within its consular functions of protection and welfare of American citizens abroad. The Department of Justice tends to view immigration as an enforcement matter, and it is not well suited to oversee an agency that also adjudicates applications for benefits. The Department of Labor is concerned primarily with the labor market impact of immigration. The Department of Health and

Human Services plays an important role in setting and implementing domestic refugee policy, but it has a very narrow, largely health-related involvement in overall immigration policy.

Recognizing the drawbacks inherent in choosing any of these locations, the Commission nevertheless concluded that the Department of State has the greatest capacity to undertake the additional work entailed in a consolidated system.

Taking responsibility for immigration and citizenship services out of the Department of Justice sends the right message, that legal immigration and naturalization are not principally law enforcement problems; they are opportunities for the nation as long as the services are properly regulated. Further, the Department of Justice does not have the capacity internationally to take on the many duties of the Department of State. The Department of State, however, already has a domestic presence and an adjudicatory capability. It issues one-half million immigrant visas and six million nonimmigrant visas each year. DOS also provides a full range of citizenship services both domestically (issuance of almost six million passports annually) and abroad (e.g., citizenship determinations and registration of births of U.S. citizens overseas). Indeed, DOS has devoted a major share of its personnel and its capital and operating resources to these adjudicatory functions at embassies and consulates in more than two hundred countries and in passport offices in fifteen U.S. cities. In addition, the National Visa Center in New Hampshire processes and forwards to overseas posts three-quarters of a million immigrant cases.

Consolidating responsibility requires some changes in the way the Department of State administers its immigration responsibilities, which we believe would strengthen the adjudication function. This increase in domestic responsibilities may raise concern over possible decrease in attention and focus on the Department of State's tradi-

tional mandate in foreign affairs, as well as more practical caution regarding the well-known difficulties in managing the domestic aspects of immigration. Some observers also may be concerned that DOS might not give sufficient consideration to the domestic impact of immigration. To counter this perception (and some underlying reality), the Department of State would need to develop mechanisms for consultation with domestic groups representing a broad range of views and interests regarding immigration.

The Department of State also will need to change its historic position on review of consular decisions. At present, decisions made at INS and the Department of Labor on many immigrant and LDA applications may be appealed, but no appeal is available on consular decisions. The Commission believes that immigrant and certain limited duration admission visas with a U.S. petitioner should be subject to independent administrative review [see below]. The Department of State also would have to prepare its own bureaucracy to take on these new functions. A need for a renewed emphasis on training for the management of large and interrelated offices and processes will be matched by the need for superior personnel management and leadership. These highly-regarded management skills would be an ideal attraction for those Foreign Service officers who shy away from consular assignments abroad, perceiving them as unwanted digressions from the classic diplomatic career path.

The new organization would be responsible for naturalization and determination of citizenship, adjudication of all immigrant and limited duration admission petitions, work authorizations and other related permits, and adjustments of status. It also would have responsibility for refugee status determinations abroad and asylum claims at home. Overseas citizenship services would continue to be provided by consular officers abroad and in Washington. Policy and program development for all immigration activities would be incorporated into the new organization, which also would have

enhanced capacity to detect, deter, and combat fraud and abuse among those applying for benefits.

With consolidation, the Department of State would have sole responsibility for processing immigrants—from the filing of the petition in the United States and subsequent visa issuance abroad, to the production of the green card and work authorization in the U.S., and ultimately, to naturalization. Issuance of a passport to the newly-naturalized citizen would complete this almost seamless process of immigration benefits adjudications. Consolidation of these steps would permit greater operational flexibility (e.g., one-stop adjudication of petitions and forwarding to posts abroad, streamlined processing for work-related visas), greater flexibility in use of personnel (e.g., the examination function could span visa petitions and passports), and, as discussed below, greatly enhanced antifraud capabilities.

The consolidation of these functions in DOS would, of course, be a major undertaking for a relatively small department already charged with absorbing the United States Information Agency and the Arms Control and Disarmament Agency. The Department of State must be given the resources to fulfill such new responsibilities. The approximately five thousand INS and Department of Labor staff currently involved in immigration applications adjudications would likely be transferred to DOS. Many employees would remain in or near their present locations and their functions would not appreciably change.

This recommendation envisions creation of an Undersecretary who would have direct access to the Secretary of State and who would be responsible for domestic and overseas immigration, citizenship, and refugee functions.

Within the Office of the Undersecretary would be a unit responsible both for formulating and assessing immigration policy as well as

reviewing and commenting on the immigration-related effects of foreign policy decisions. This policy capacity would be new for the Department of State, but it is in keeping with the important role that migration now plays in international relations.

The Undersecretary would have three principal operating bureaus:

A Bureau of Immigration Affairs [IA] would focus on the immigration process, as noted above, as well as on LDA processing. IA's expanded responsibilities would be based on those currently assigned to the Visa Office and the National Visa Center. In addition to its existing overseas work, the Bureau of Immigration Affairs would be responsible for domestic adjudication/examination functions, including work authorization, adjustment of status, domestic interviewing, and the issuance of appropriate documentation (e.g., green cards). The Bureau of Immigration Affairs also would staff immigration information and adjudication offices in areas with immigrant concentrations. Related INS legal and regulatory staffs in Washington also would transfer to the IA Bureau, as would DOL functions regarding employment-based entry. In short, the IA Bureau would assess—in the U.S. and abroad—applications for all immigration-related benefits now performed by INS, DOL, DOS, and USIA.

Importantly, the employment verification system outlined in previous Commission recommendations also would be under the Department of State's control, although it would likely contract out the actual operation of that system. Another important part of its domestic presence would be the staffing of immigration information offices in areas of major immigrant concentrations.

A Bureau of Refugee Admissions and Asylum Affairs would assure an appropriate level of independence from routine immigration issues and processes. It would combine the present Bureau for Population, Refugees and Migration [PRM] responsibilities for over-

seas refugee admissions, the refugee and asylum offices of the INS, and the DOS asylum office in the Bureau of Democracy, Human Rights and Labor.[2] This would integrate the key governmental players in one of our most important and historic international activities. In this vein, the direct line of authority to the Secretary of State through the new Undersecretary underlines the key policy advantage for global refugee issues.

A Bureau of Citizenship and Passport Affairs would be responsible for naturalization, other determinations of citizenship, and issuance of passports. Local offices performing some citizenship functions, such as overseas travel information, passport and naturalization applications, testing and interviews, could be located at the new or expanded immigration offices noted below.

Overseas citizen services would continue to be handled within the new consolidated organization, utilizing the DOS substantial domestic and overseas staff. These services include: responding to inquiries as to the welfare or whereabouts of U.S. citizens; assisting when U.S. citizens die, are arrested, or experience other emergencies abroad; providing notarial services; and making citizenship determinations and issuing passports abroad. In some countries experiencing instability, an increasingly important activity is organizing Americans living or working in those areas into networks for efficient communication of information and warnings.

Quality Assurance Offices would oversee records management, monitoring procedures, fraud investigations, and internal review. At present, monitoring of the quality of decisions made on applica-

---

[2] The Commission makes no recommendation regarding the management or organization of the overseas refugee and humanitarian assistance programs operated by PRM and the USAID Bureau for Humanitarian Response. These functions could remain within the Undersecretary for Global Affairs or be brought under the new Undersecretary for Citizenship, Immigration, and Refugee Admissions.

tions for immigration and citizenship benefits receives insufficient attention. INS enforcement officials now have the responsibility to investigate allegations of fraud in immigration and naturalization benefits programs, but monitoring the adjudications process is a low priority in an office that is also responsible for identifying and removing criminal aliens, breaking up smuggling and counterfeiting rings, and performing similar police work. A staff responsible for and dedicated to ensuring the quality of decisions taken on applications for immigration and citizenship should address some of the weaknesses, such as those recently identified in the naturalization process.

Some adjudication decisions now are reviewed by a separate administrative unit within the agency conferring benefits; others are not. The Commission believes that quality decisions require some form of supervisory review for applicants who believe their cases have been wrongly decided. This type of review helps an agency monitor consistency and identify problems in adjudication and offers a means of correcting errors. At present, DOS has procedures for some internal supervisory review of consular decisions, but it has had no need for procedures to review refusals of applications at earlier stages of adjudication. With expanded responsibilities, DOS will need to develop a comprehensive internal review process that ensures that errors are corrected with minimal disruption to the applicant and the agency.

Quality assurance requires good records. The accrued personal records of each immigrant must be accurate, up-to-date, and retrievable at each adjudicative stage: (1) petition/immigrant visa; (2) alien resident/green card; (3) naturalization; and (4) passport. The creation and maintenance of the alien filing system ("A" files) should be reviewed to assure its maximum utility in the adjudicative flow noted above. The absolute need for good immigration records cannot be overstated.

Standardized and flexible records management and the consolidation of domestic and overseas adjudication functions will greatly enhance antifraud capabilities. At present, fraud often is not discovered until after a government agency has given the case one or more approvals and the alien appears for his or her visa. The resources are not now in place for adequate review of questionable petitions, and communications between overseas posts and domestic agencies are not adequate. Even when they receive information from overseas posts about likely fraud, the domestic agencies generally do not follow up with further investigation. Consolidation within the Department of State would overcome poor coordination and communication and permit more antifraud efforts at the beginning of the process, where they are most effective. A fraudulent entry prevented, a work permit not issued to an unauthorized person, or an ineligible alien prevented from naturalization—these are far more preferable to trying to rescind a benefit granted in error.

With respect to the domestic field structure for implementing these programs, The Regional Service Centers and National Visa Center would continue to be the location of most adjudication. The physical plants are excellent and the locally-hired staffs are trained and in place. At this time, information is passed from the RSCs to the NVC when the applicant for admission is overseas. Eventually, however, the functions of the Service Centers and the Visa Center might be consolidated. Overseas interviews would continue to take place at embassies and consulates.

A range of other interviews would take place domestically. The Department of State already operates fifteen passport offices throughout the United States, many in areas of high immigrant settlement. These offices, however, are not set up for high volume interviewing. New offices, designed specifically with immigrant services in mind, would be needed. Ideally, to avoid long lines and waits for service, there would be smaller offices in more locations than the current INS district offices. The Commission recommends against locating

these offices with the enforcement offices discussed above. Asking individuals requesting benefits or information to go to an enforcement agency sends the wrong message about the U.S. view of legal immigration.

Immigration-Related Employment Standards (DOL)

The Commission recommends that all responsibility for enforcement of immigration-related standards for employers be consolidated in the Department of Labor. These activities include enforcing compliance with requirements to verify work authorization and attestations made regarding conditions for legal hire of temporary and permanent foreign workers. The Commission believes that as this is an issue of labor standards, the Department of Labor is the best equipped federal agency to regulate and investigate *employer compliance* with standards intended to protect U.S. workers. The hiring of unauthorized workers and the failure of employers to comply with the commitments they make (e.g., to pay prevailing wages, to have recruited U.S. workers) in obtaining legal permission to hire temporary and permanent foreign workers are violations of such labor standards. Responsibility for enforcing compliance with these requirements currently lies within both INS and DOL. Under consolidation, the DOL Employment Standards Administration's [ESA], Wage and Hour Division [WH] and Office of Federal Contract Compliance Programs [OFCCP] would perform these functions in conjunction with their other worksite labor standards activities.

The Commission recommends that all responsibility for enforcement of immigration-related standards for employers be consolidated in the Department of Labor.

These increased immigration-related responsibilities would require increased DOL staff and resources. In addition to performing all worksite inspections, DOL would assume new employer sanctions responsibilities. Specifically, the Commission makes the following recommendations regarding the DOL role in regulating the worksite to ensure the protection of U.S. workers.

Sanctions against employers who fail to verify work authorization. Among its provisions that address the problem of unauthorized immigration, the Immigration Reform and Control Act of 1986 made it unlawful for an employer knowingly to hire any alien not authorized to work in the U.S. IRCA requires all employers to check the identity and work eligibility documents of all workers hired. Upon hiring, employees must sign an I-9 Form certifying eligibility to work and that the documents they present to the employer are genuine. The employer then signs the form, indicates which documents were presented, and attests that they appear to be genuine and to relate to the individual who was hired. IRCA established penalties both for employers failing to comply with this process and for employers knowingly hiring unauthorized aliens. Pilot testing of a more rigorous verification process recommended in the Commission's 1994 report and adopted in large part in the immigrant legislation passed in 1996 addresses verification problems arising from the widespread use of fraudulent documents by illegal aliens.

The Commission believes all worksite investigations to ascertain employers' compliance with employment eligibility verification requirements should be conducted by the Department of Labor. Although DOL already conducts many of these investigations, under this recommendation, DOL also would assess penalties if employers fail to verify the employment eligibility of persons being hired. DOL would not be required to prove that an employer knowingly hired an illegal worker, just that the employer hired a worker without verification of his or her authorization to work. With implementation of the Commission's proposal for a more effective verification process, this function will be critical to deterring the employment of unauthorized workers.

At present, INS has the principal responsibility for employers sanctions enforcement, including: investigations and prosecution of "knowing hires" of illegal aliens and paperwork violations; worksite

raids that apprehend and remove illegal aliens; and development and maintenance of employee eligibility verification programs designed to help employers determine which individuals are authorized to work in the United States. DOL also reviews employer compliance with the employer sanctions verification processes in the course of its on-site visits to workplaces and as part of regular labor standards enforcement activities. DOL Wage and Hour and OFCCP personnel inspect the I-9 Forms on file and notify INS of the results of such inspections. DOL also is authorized to issue warning notices to employers when deficiencies are found in an employer's verification process. In practice, however, DOL has rarely issued such warnings.

Although INS and DOL jointly enforce the employer sanctions provisions, INS has the primary responsibility, including assessing civil penalties and initiating legal action. A Memorandum of Understanding between DOL and INS retains for INS the responsibility for promulgating employer sanctions program policy.

Consolidating verification enforcement at DOL gives responsibility to an agency with extensive experience regulating business compliance with labor standards, an expertise largely lacking at INS. It also permits a relatively high level of enforcement activity, as DOL completes far more employer visits than INS. The number of employer sanctions cases completed by INS has decreased sharply from 14,311 in 1990 to 5,211 in FY 1996, of which 90 percent were cases in which the agency had some reason to believe a violation occurred.[3] Over the past several years, the number of Wage and Hour on-site investigations also has decreased substantially but is still well above the INS level. The DOL reduction results largely from

[3] The lowered activity, nevertheless, represents more targeted and effective enforcement. The number of arrests during this same period increased more than 50 percent. In 1,024 cases the employers were fined; warnings were issued in 669 cases; $4,853,288 was collected in fines; and 13,848 undocumented workers were arrested.

a greatly expanded use of expedited investigations in the form of employer self-audits and conciliations in place of on-site investigations. For example, Wage and Hour conducted more than 42,000 on-site investigations and corresponding I-9 inspections in FY 1990, but less than 23,000 in FY 1996. OFCCP conducts some 4,000 on-site inspections each year. In FY 1996, approximately 70 percent of Wage and Hour investigations were complaint-driven; the remaining 30 percent were directed or targeted. Wage and Hour devotes the equivalent of twenty-one full-time employees to I-9 inspections, OFCCP the equivalent of eight.

The Commission recognizes DOL concern that from the begining its assumption of an employer sanctions enforcement role created a potential conflict with its broader mission of protecting the wages and working conditions of workers. Its inspectors worry that workers' fears that such employer sanction actions might result in INS apprehension and deportation could have a "chilling effect" on those workers who might—and should—come forward to report workplace abuses. For this reason, DOL has been extremely wary of crossing the hard-to-distinguish line where sanctions-related activities might effectively frustrate its ability to protect deserving workers.

The Commission believes that DOL participation in verifying that only authorized workers are hired should be seen as integral to its mission of protecting U.S. workers. DOL has an essential interest in reducing illegal migration as those employers who hire illegal aliens are more likely to violate the minimum labor standards that DOL is charged with enforcing. A reduction in levels of illegal migration could well be the most effective tool available to enhance protections for legally authorized workers. The primary responsibility of DOL is protecting American workers, and transfer of employer sanctions enforcement to DOL represents the best option for raising the level of enforcement to a point that presents a real deterrent to the employment of undocumented workers.

Enforcement of skill-based immigrant and limited duration **admissions requirements.** In our 1995 report to Congress, the Commission urged adoption of streamlined procedures for the admission of skilled foreign workers whom U.S. businesses wish to hire. We continue to believe that an expedited process is needed for the admission of both temporary and permanent foreign workers, as discussed earlier in this report, as long as adequate safeguards are in place to protect the wages and working conditions of U.S. workers. To prevent abuse of an expedited system, an effective postadmissions enforcement scheme is necessary.

Upon adoption of an expedited process for the admission of both immigrant and temporary workers, DOL should be given responsibility and resources for enhanced monitoring of employers' fulfillment of the attestation terms they filed to bring in workers. As discussed above, decisions on who will be admitted under the various skill-based admission categories would be made by the Department of State.

DOL's other worksite enforcement responsibilities place it in the best position to monitor employers' compliance with the attestations submitted in the admissions process. DOL investigators are experienced in examining employment records and interviewing employees. Penalties should be established for violations of the conditions to which the employer has attested, including payment of the appropriate wages and benefits, terms and conditions of employment, or any misrepresentation or material omissions in the attestation. Such penalties should include both the assessment of administrative fines as well as barring egregious or repeat violators from petitioning for the admission of permanent or temporary workers.

When DOL has concluded that an employer is an egregious or repeat violator, and any subsequent administrative appeal has been decided, it would notify the DOS Bureau of Immigration Affairs of such findings, with a recommendation about barring the employer

from petitioning for the admission of foreign workers for temporary or permanent employment. The Bureau of Immigration Affairs would then determine if such a debarment is to be made and would notify the employer of its decision. The employer would have the option of appealing such a decision.

The Commission recommends that administrative review of all immigration-related decisions be consolidated and be considered by a newly-created independent agency, the Agency for Immigration Review, within the Executive Branch.

Agency for Immigration Review

The Commission recommends that administrative review of all immigration-related decisions be consolidated and be considered by a newly-created independent agency, the Agency for Immigration Review, within the Executive Branch.

The Commission believes that a system of formal administrative review of immigration-related decisions—following internal supervisory review within the initial adjudicating agency—is indispensable to the integrity and operation of the immigration system. Such review guards against incorrect and arbitrary decisions and promotes fairness, accountability, legal integrity, uniform legal interpretations, and consistency in the application of the law in individual cases and across the system as a whole.

Experience teaches that the review function works best when it is well insulated from the initial adjudicatory function and when it is conducted by decisionmakers entrusted with the highest degree of independence. Not only is independence in decisionmaking the hallmark of meaningful and effective review, it is also critical to the reality and the perception of fair and impartial review.

To the extent that administrative review of immigration-related decisions is authorized under current law, such review is conducted by several Boards and units located in the Departments of Justice, Labor, and State. For example, within the Department of Justice, the Executive Office for Immigration Review, a separate agency es-

tablished by regulation in 1983, oversees the system of immigration courts, as well as the Board of Immigration Appeals [BIA]. The BIA, a fifteen-member panel appointed by the Attorney General, has nationwide jurisdiction over a wide range of cases, including decisions of Immigration Judges in exclusion, deportation, and removal proceedings, and requests for relief made in those proceedings. In addition, the BIA adjudicates appeals in several other categories of cases, such as bond determinations, fines, rescission of adjustment of status, and certain family-based visa petitions.

Supplementing their normal hearing docket, Immigration Judges now conduct the final review of the "credible fear" of persecution determinations made in the admission/inspection process, as well as determinations that an alien seeking admission is not currently a lawful permanent resident, refugee, or asylee as he or she claims.

The Office of the Chief Administrative Hearing Officer [OCAHO] also is housed in EOIR and is responsible for administering the hearing process issues arising under the employer sanctions, anti-discrimination, and document fraud provisions of the Immigration and Nationality Act.

Within the Immigration and Naturalization Service there is an Administrative Appeals Office [AAO], whose component parts include the Administrative Appeals Unit [AAU] and the Legalization Appeals Unit [LAU]. Unlike the BIA, the AAO does not have a decisionmaking board. Rather, the Chief of the Unit reviews and signs off on decisions prepared by individual examiners. AAO has appellate jurisdiction over petitions and applications in no fewer than thirty-nine subject areas, among which are decisions relating to the breaching of bonds, employment-based visa petitions, adjustment of status for Indochinese refugees, petitions for Amerasian children, fiancé(e)s, orphans, temporary workers, permission to reapply for admission after deportation or exclusion, reentry permit waivers for certain grounds of excludability, certification of schools

for acceptance of foreign students, applications for refugee travel documents, claims to acquisition of citizenship abroad, applications to preserve residence abroad for naturalization purposes, various applications for certain certificates of naturalization, and applications for temporary or permanent resident status under the regular legalization, Special Agricultural Worker or Replenishment Agricultural Worker programs, and corresponding waivers of inadmissibility.

Appeals of denials of naturalization applications, however, are not considered by the AAO. Instead, review of such decisions occurs at the INS district office level and is conducted by an officer of equal or higher grade as the initial adjudicator. (If the initial decision denying the naturalization application is sustained, the alien may challenge the decision in federal district court, the court having jurisdiction over the ultimate swearing-in of successful naturalization applicants.)

In the Office of the Legal Adviser in the Department of State, there is a Board of Appellate Review [BAR] vested with jurisdiction to hear, in part, appeals of determinations of loss of nationality or expatriation, and denials, revocations, restrictions, or invalidations of passports.

In the Department of Labor, the Board of Alien Labor Certification Appeals [BALCA], created by regulation in 1987, hears appeals of denials of applications for labor certification.

When considering the appellate review function in its totality, it becomes apparent that responsibility for reviewing enforcement-related decisions rests primarily with the individual components of EOIR, while responsibility for reviewing benefit adjudication decisions is spread across several offices and agencies including the BIA, AAO, INS district offices, BALCA, and, for a more limited set of

nationality- and citizenship-related issues, the BAR at DOS. Further, Immigration Judges and the BIA have the authority to provide certain forms of relief during deportation, exclusion, and removal hearings that can result in lawful permanent resident status for aliens.

Inasmuch as the underlying benefits and enforcement functions performed by the immigration system are themselves dispersed among several Departments, it is not surprising to find that formal administrative review of decisions made in the context of performing those functions is likewise dispersed. However, in light of our recommendations that responsibility for the enforcement of the immigration laws be placed with a new Bureau for Immigration Enforcement in the Department of Justice and that all citizenship and immigration benefits adjudications be removed from the Department of Justice and instead be consolidated in the Department of State, we find that a corresponding change in the placement of responsibility for the review function is in order.

Even with the assignment of the benefits adjudication function to DOS and the enforcement function to DOJ, interrelationships will exist between eligibility for benefits and enforcement actions. Indeed, eligibility for an immigration benefit may be an avenue to relief from deportation, exclusion, or removal while certain immigration violations may present barriers to attaining legal status. For example, favorable disposition of a petition or application by the benefits agency may collaterally resolve a deportation or removal issue. Aliens in enforcement proceedings may be eligible for certain forms of relief involving the same types of legal questions arising in the context of benefits adjudication outside of proceedings—or aliens in proceedings may be foreclosed from eligibility for a benefit applied for outside of proceedings. Ultimately, however, there is a need for a uniform administrative interpretation of what the law is and how it should be applied, regardless of whether the questions arise when adjudicating an application for a benefit or resolving an

enforcement action. These considerations lead us to conclude that administrative review of all presently reviewable immigration-related decisions should be consolidated.

In deciding where the review function could best be performed, the Commission considered a number of options, including separate reviewing bodies for enforcement actions within DOJ and forbenefit determinations within DOS, placing responsibility for review entirely with EOIR, and creation of an Article I Immigration Court.

Placing the review function in its entirety with EOIR was an attractive option, particularly given EOIR's success in both insulating the review function and achieving independence of decisionmaking since its inception in 1983. At the same time, EOIR remains located in the Department of Justice, ultimately and predominantly a law enforcement agency. Further, existing procedures permit the Attorney General to reverse or modify any decision reached by the BIA. The Commission, as well as other commentators, find this practice troubling because, at a minimum, it compromises the appearance of independent decisionmaking, injects into a quasi-judicial appellate process the possibility of intervention by the highest ranking law enforcement official in the land, and, generally, can undermine the BIA's autonomy and stature. In the end, the Commission decided the EOIR option was unworkable because of the inherent difficulty of a reviewing agency in one Department rendering decisions in cases initially decided by another Department.

Instead, the Commission was persuaded by the arguments that the review function should be completely independent of the underlying enforcement and benefits adjudication functions and that the reviewing officials should not be beholden to the head of any Department. Although the desired independence could be attained by establishing an Article I Immigration Court, such a court would be part of the Judicial, rather than the Executive Branch. The overall operation of the immigration system requires flexibility and coordi-

nation of function, including the review function, by the various agencies in the Executive Branch. Given this reality, the Commission concluded that the review function should be conducted by a newly-created independent reviewing agency in the Executive Branch. To ensure that the new reviewing agency is independent and will exist permanently across Administrations, we believe it should be statutorily created. It would incorporate the activities now performed by several existing review bodies and offices, including the DOJ Executive Office for Immigration Review, the INS Administrative Appeals Office and district offices (naturalization), the DOL Board of Alien Labor Certification Appeals, and the limited set of nationality and citizenship-related matters presently considered by the DOS Board of Appellate Review. The Agency for Immigration Review also would have additional responsibilities.

Creating any decisional system or tribunal requires attention to several guiding principles. First, no system can work effectively if the personnel who form the base of the decisional pyramid are insufficient in number or deficient in skills and integrity to do the job. Second, the base of any such structure cannot be expanded either in number of its personnel or in extent of its jurisdiction beyond the capacity of the next level above to review and decide the outcome. This must be achieved within a reasonable period and with a reasonable expenditure of resources. Finally, the apex of any decisional pyramid should be relatively small. With these considerations in mind, the Commission proposes the following organization for the new independent Agency for Immigration Review.

This new reviewing agency would be headed by a Director, a presidential appointee, who would coordinate the overall work of the agency, but who would have no say in the substantive decisions reached on cases considered by any division or component within the agency. There would be a trial division headed by a Chief Immigration Judge, appointed by the Director. The Chief Judge would oversee a corps of Immigration Judges sitting in immigration

courts located around the country.[4] The Immigration Judges would hear every type of case presently falling within the jurisdiction of the now sitting Immigration Judges.

The new reviewing agency also would consider appeals of decisions by the benefits adjudication agency, using staff with legal training. Although the benefits adjudication agency will handle a wide range of applications—from tourist visas to naturalization and the issuance of passports—not all determinations will be appealable, as is the case under current law. We envision that those matters that are appealable under current law would remain appealable. The only difference is that the appeal would be lodged with and considered by the new independent Agency for Immigration Review rather than by the various reviewing offices and Boards presently located among the several Departments.

The administrative appeals division also would consider appeals from certain visa denials and visa revocations by consular officers. Under current law, such decisions are not subject to formal administrative or judicial review.

When a visa is denied, important interests are at stake. To be sure, the visa applicant is adversely affected—but more importantly at stake are the interests of the United States citizens, lawful permanent residents, employers, and businesses who have petitioned the admission of the applicant or who otherwise have an interest in having the applicant present in the United States. Given the lack of formal administrative and judicial review of consular decisions, these individuals are left with little or no recourse.

---

[4] Admittedly, currently sitting Immigration Judges perform the classic review function only to a very limited degree—for the most part they serve as initial decisionmakers in cases where aliens are placed in proceedings. Notwithstanding this circumstance, however, experience teaches that Immigration Judges should find their home in the same agency as the appellate reviewing Board, not the enforcement agency that is initiating the proceedings against the alien.

The Commission believes that consular decisions denying or revoking visas in specified visa categories, including, all immigrant visas and those LDA categories where there is a petitioner in the United States who is seeking the admission of the visa applicant, should be subject to formal administrative review. The visa applicant would have no right to appeal an adverse determination. Instead, standing to appeal a visa denial or revocation would lie only with United States petitioners, whether U.S. citizens, lawful permanent residents, or employers.

An appellate Board would sit over the trial and administrative appeals divisions of the new independent Agency for Immigration Review. This appellate Board would be the highest administrative tribunal in the land on questions and interpretations of immigration law. It would designate selected decisions as precedents for publication and distribution to the public at large. Its decisions would be binding on all officers of the Executive Branch. To ensure the greatest degree of independence, decisions by the Board would be subject to reversal or modification only as a result of judicial review by the federal courts or through congressional action. Neither the Director of the reviewing agency nor any other agency or Department head could alter, modify, or reverse a decision by the appellate Board.

The appellate Board would be headed a Chairman. Both the Chair and Vice Chair would be appointed by the President for staggered terms of at least ten years. The appellate Board would have as many Members, who would be appointed by the Chair, as needed to decide appeals in a timely manner. It would consider appeals from the categories of cases presently falling within the BIA's jurisdiction, subject to the above-noted modifications. In addition, the appellate Board could entertain appeals from decisions of the administrative appeals division in cases in which a novel or significant

legal issue were presented, or in any other case in which it was deemed necessary or appropriate.

The Office of the Chief Administrative Hearing Officer, presently housed in EOIR, would operate as a separate component in the Agency for Immigration Review and would perform the same work as is presently being conducted. Of course, the precise organizational arrangements and divisional jurisdictions could be subject to future modification following a comprehensive review by the Agency for Immigration Review of the types and volume of cases received. However, to meet the challenges presented by consolidation of all immigration-related appeals in one place, and to perform its critical mission of correctly and expeditiously resolving appeals, the new reviewing agency must be given sufficient resources and staffing.

The Commission urges the federal government to make needed reforms to improve management of the immigration system.

MANAGEMENT REFORM

The Commission urges the federal government to make needed reforms to improve management of the immigration system. While the Commission-recommended structural changes will help improve implementation of U.S. policy, certain management reforms must also be adopted if the agencies responsible for immigration matters are to be effective in performing their functions. Structural reforms will not by themselves solve some of the management problems that have persisted across Administrations in the immigration agencies.

More specifically, the Commission recommends:

- **Setting more manageable and fully-funded priorities**. The Commission urges Congress and the Executive Branch to establish and then appropriately fund a more manageable set of immigration-related priorities. By this we mean establishing fewer objectives, but also setting more integrated

priorities, more realistically-achievable short-term and long-term goals, and greater numerical specificity on expected annual outcomes to which agencies should be held accountable.

The processes by which both Congress and the Executive Branch plan and allocate resources constrain the development of a more manageable set of priorities. Currently, most immigration priorities result from Legislative/Executive interaction through a multiyear budget process. Government budgeting cycles are lengthy and complex. Agencies must work simultaneously with the budgets and reporting cycles of four fiscal years.[5] Congressional action, meanwhile, consists of the doubly bifurcated processes of authorization, followed by separate appropriations in the House of Representatives and the Senate, and then by resolution in conference.

Executive Branch departments seldom identify adequately how much money they need to accomplish the entirety of a specified goal. Nor do they do a good job of scaling back or increasing objectives depending on the resources appropriated. Within the Legislative Branch, there is little coordination among congressional committees to ensure a congruence of agreed-upon priority expectations and resources actually allocated to do the job. Consequently, transparency and accountability are not built into the system. For example, Congress is not held accountable for adding new priorities without appropriating resources to accomplish all of the specified tasks. Federal agencies are neither directly nor easily held accountable for their performance in achieving or not achieving agreed-upon results.

The Commission urges Congress and the Executive Branch to refrain from overpromising what the federal government

can accomplish in implementing immigration policy. For example, rather than defining the removal of all deportable and inadmissible aliens as the priority for removal, a goal that is presently not achievable, the federal government could define removal priorities in terms of specified numbers and categories of aliens (e.g., criminal aliens) and in terms of certain strategies. For example, a "last in, first out" strategy would remove everyone who newly enters the removal system before removing persons whose cases have been pending in backlogs for some time. This priority-setting process worked well in reforming the asylum process and could be replicated in other areas.

Priority setting must be accompanied by sufficient resources to undertake the top objectives. In the case of removals, it should include resources for Investigations, Trial Attorneys, Immigration Judges, the BIA Detention and Deportation Officers, Department of State liaisons with host countries, and such needs as vehicles, equipment, training, and support. The priority should identify the problem completely and clearly and map out which part of that problem will be solved in which of several years of the priority. And then Congress should agree and the Executive Branch should be held accountable.

- **Developing more fully the capacity for policy development, planning, monitoring, and evaluation.** In general,

[5] For example, for the second quarter [January-March] of FY 1997, federal agencies were:
- For FY 1996, completing '96 year-end statistics and reports;
- For FY 1997, continuing work on implementing '97 goals and priorities;
- For FY 1998, finalizing the President's February FY 1998 Budget Submission to the Congress and explaining/defending it at congressional committee hearings;
- For FY 1999, developing the '99 budget initiatives, priorities, and strategies to be submitted to OMB under the "Spring Plan" planning process.

the current immigration system suffers from an inability to develop, sustain, and clearly articulate long-term and short-term policymaking except in times of crisis. Often this has led to bad policymaking, poorly developed programs, inadequate policy coordination across departmental lines, and almost nonexistent program assessment and evaluation of outcomes. None of the main Executive Branch departments has developed a broad-based immigration policymaking capacity.

The most developed policymaking and coordination unit in the immigration system exists in the INS Office of Policy and Planning [OPP]. However, a majority of its eighty-five people and its $5 million personnel budget are related to statistics and other nonpolicymaking activities. Moreover, while it is important for the principal agency responsible for immigration enforcement to have its own policy and planning capability, OPP is not necessarily well positioned to advise the Department of Justice about immigration-related policy issues affecting other DOJ agencies. Further, under the Commission's proposed restructuring, it would make no sense for the agency responsible for enforcement to have lead responsibility for formulating policies related to legal immigration and naturalization or enforcement of immigration-related labor standards.

Each department with immigration-related responsibilities needs to perform a wide range of policy functions, including, but not limited to, long-range and strategic policy planning, interagency policy integration, policy review, policy coordination, priority setting, data collection and analysis, budget formulation, decisionmaking, and accountability. The Domestic Policy Council and the National Security Council, both situated in the White House can also play an important role in coordinating policy development across departments.

Informed policymaking requires systematic review of current policies and programs (which themselves should be informed by reliable and timely statistical information), development of a range of options, and analysis of the advantages and disadvantages (including costs and timeframes) of each. Further, immigration policy affects, and is affected by, a wide range of other issues of interest to the departments. For example, the DOL overall labor policy is affected by immigration as the foreign-born represent a large proportion of the growth in the labor force. As a proportion of the unskilled workforce, immigrants represent an even larger proportion and potential impact. Similarly, international migration and the foreign policy and national security interests of the United States are strongly connected.

The immigration-related policymaking capacities at the departmental level in Justice, State, and Labor tend to be *ad hoc* and understaffed. For example, the Office of the Deputy Attorney General [DAG] has two and one-half to three attorneys working on immigration-related policy and program coordination. These staff serve as a clearinghouse through which immigration-related concerns and policy matters pass from the responsible agencies (e.g., INS, EOIR, Office of Special Counsel for Immigration-Related Unfair Employment Practices, Office of Immigration Litigation) through the DAG to the Attorney General. Given the wide range of policy issues requiring department-level attention, these staff have an all but unmanageable policy portfolio. Much of their time is spent on routine oversight punctuated by crisis management, with little time left for long-range policy development or planning. The Commission believes more sustained and timely attention to immigration policy issues within and across departments will help improve both the formulation and implementation of programs.

Interagency coordination of immigration policymaking also is particularly important. The Domestic Policy Council [DPC] already plays such a role. The Commission recommends strengthening the DPC's capacity to provide policy guidance, particularly when immigration matters affect or are affected by other domestic interests. Designation of a senior focal point for immigration policy in the DPC would enhance its ability to coordinate policy development. This role would be complementary to the enhanced role the Commission recommended for the National Security Council with regard to refugee issues. The DPC and the NSC would coordinate closely when migration issues relate to U.S. foreign policy and national security interests.

More specifically, the DPC should be mandated and staffed to: oversee federal immigration policy development across departmental and agency lines; monitor the execution and impact of new legislation, policies and programs; resolve differences within the Executive Branch, focusing on those that impede the capacity of the federal government to deliver a single, coherent message about immigration policy and priorities; serve as a forum for discussion of new ideas; coordinate liaison with and the input of advocates and other nongovernmental agencies concerned with federal immigration decisionmaking; and relay the resulting recommendations to Congress and the President.

- **Improving systems of accountability.** The Commission believes strongly that staff who are responsible for immigration programs should be held accountable for the results of their activities. Systems should be developed to reward or sanction managers and staff on the basis of their performance. This requires the development of performance measures that relate to expected outcomes. For example, the Commission earlier recommended rewarding Border Pa-

trol staff for their effectiveness in deterring illegal migration rather than their prowess at apprehending illegal aliens. Similarly, managers responsible for adjudication of benefits should be rewarded if they lessen processing time for the approval of applications and, simultaneously, improve their detection of fraudulent cases. By contrast, managers who fail to meet recognized operating standards should be held accountable and be sanctioned for their noncompliance. Systems to reward innovation or sanction managers and staff on the basis of their performance also need to be developed. Too often, staff who try new approaches not only are not rewarded for their initiative, they are sanctioned by their colleagues and supervisors.

- **Recruiting and training managers.** The Commission believes improvements must be made in the recruitment and training of managers. As immigration-related agencies grow and mandated responsibilities increase or evolve, closer attention should be paid to improving the skills and managerial capacity of immigration staff at all levels to ensure more efficient and effective use of resources allocated.

  Since 1993, the immigration system has been undergoing a tremendous infusion of new resources and, since 1996, significantly augmented statutory mandates. Either change would seriously burden even the best-run agencies of the federal government. Such infusions of new resources to INS and to several other agencies burden agency administrative and management systems. INS has not added a sufficient number of experienced, proven managers to help the agency address the many challenges it faces.

  Agencies must be able to rapidly recruit, select, train, deploy, and then support new staff—and they must sustain

this expansionist capacity over several fiscal years. Most of the new staff added are entry-level, necessitating on-the-job training, mentoring, and close supervision before they can be considered fully functional in their jobs.

As new staff are added, new supervisors are needed—and they too need supervisory and management training to be successful. Supervisors usually are drawn from the ranks of the operational staff, and with increased operational responsibilities, they often are unable to be freed soon enough or long enough to attend supervisory training in a timely fashion.

In addition, major changes in the immigration statutes passed in 1996 necessitate the redrafting and repromulgation of hundreds of sections of law and regulations, hundreds of new or revised forms, and training and retraining of staff just to implement these profound changes. Agencies should consider new ways in which staff are trained to do their work: e.g., training in management by objectives, in accountability, in managerial and supervisory skills. For some agencies, the skill levels—and agency cultures—are not yet adequate to be successful in fulfilling present and expected future increased managerial and supervisory responsibilities. Both additional supervisors and new skills are urgently needed.

The infusion of new skills and culture can come from two sources: (1) in-house training and retraining of existing staff; and (2) the addition—from outside the agencies themselves—of new middle- and upper-level management staff possessing those skills and the ability to apply them quickly to the immigration settings. These two sources need not be mutually exclusive; some of both may be required.

One promising recent development is the INS' new "competency-based" assessment process for Border Patrol officer promotions to supervisor. The Border Patrol is the single immigration agency receiving the greatest number of new staff over the coming next several years. The objective is to test Border Patrol officers to predict more accurately their potential for success as future supervisors. According to INS, the main focus of the system is assessment of "thinking skills . . . the way supervisors and managers must think and react on a daily basis."[6] More than 1,000 Border Patrol officers have been tested, another 1,000 will be by the end of summer 1997, and testing of all remaining eligible Border Patrol Officers will be completed by the end of 1997.

- **Strengthening customer service orientation.** The Commission urges increased attention to instilling a customer-service ethic in staff, particularly those responsible for adjudication of applications for benefits. Repeatedly, but most recurringly regarding INS, the public complains of a lack of service from both their dollar and from the personnel charged with serving them. The horror stories are too common. Most individuals coming into contact with the immigration system have paid a fee—whether indirectly (such as at airports and the inspections users fees tacked onto their ticket prices) or directly (such as through the submission of a fee with their application for a benefit). They expect and should receive service that is customer-friendly and timely. Appli-

---

[6] The system is based on four assessments:
1. *Decisionmaking Situational Assessment*, measures thinking skills such as reasoning, decisionmaking, and problemsolving;
2. *In-basket Job Simulation*, measures administrative skills, such as planning/organizing and managing/organizing information;
3. *Managerial Writing Skills Exercise*, measures written communication skills; and
4. *Past Achievement Record*, measures personal qualities, such as leadership and flexibility.

cants should be treated courteously, records should be located with ease, and accurate information should be provided in a professional manner.

The absence of a separate career track for benefits adjudicators hampers efforts to attract and retain the best federal employees to these tasks. The structural reforms we recommend should help address this problem. Currently, many of those promoted into management positions within INS moved along the enforcement career track. Its higher-paid designations frequently make them eligible for such promotions before those who spend their careers in benefits adjudication. Benefits adjudication personnel should have a career track that promotes the best performers into positions of management and leadership and provides all employees with appropriate incentives as well as models worth emulating.

The primary currency of service is information—information that should be both accurate and timely. Daily, in many locations throughout the U.S., people seeking forms, information, status checks, and interview appointments, and reporting a change of address, requesting a copy of a form in their file, or requesting or extending employment authorization create long lines around local INS offices.

Immigration customers should not have to stand hours in a line to get information. Immigration processes should be reengineered to ensure that information is easily available at several locations and through several electronic means and, when given, is accurate. Several ways to improve access to forms and information, many electronic, already are in development. Forms increasingly are available on Information Kiosks located in high volume immigration centers; soon they will be available over the Internet. The website devel-

oped by the Department of State's Bureau of Consular Affairs makes available pertinent information on conditions throughout the world.

Customer-service personnel should be both initially well-trained and periodically tested to ensure they remain current with the latest changes and interpretations of policy. In addition, there should be a formal quality assurance program. For customer service representatives working on the lines at district field offices or answering questions on the telephone, quality assurance of their work should include the possibility for supervisors to monitor the correctness and manner of delivery of the service given.

- **Using fees for immigration services more effectively.** The Commission supports the imposition of users fees, but emphasizes that: (1) the fees should reflect true costs; (2) the agencies collecting the fees should retain and use them to cover the costs of those services for which the fees are levied; (3) those paying fees should expect timely and courteous service; and (4) agencies should have maximum flexibility to expand or contract their response expeditiously as applications increase or decrease.

  The current situation has a number of weaknesses. First, some programs are now undercharging (or not charging) fees while others reportedly are overcharging. INS is now reviewing its fees to determine where adjustments should be made. Second, some fees go into the General Treasury while others are held by the agencies collecting them and used for the function for which they were collected. Third, agencies do not have effective systems for accurately anticipating the volume of applications, forecasting their fee receipts, and requesting appropriate levels of funding from fee accounts to meet demand. Fourth, when there is an

unforeseeable increase in the number of applications, there is a significant lag time before an agency is able to use the increased fee revenue to expand its service capacity. For example, it took several months to develop a reprogramming request and then obtain permission for a reprogramming of funds when naturalization and section 245(i) adjustment applications increased significantly. This delay resulted in a growing backlog of persons awaiting service. Providing more flexibility would require agreement from the congressional appropriations committees that they need not approve the reprogramming of fees when the need for additional resources is related solely to an increase in the volume of applications.

IMPROVED DATA AND ANALYSIS

The Commission reiterates its 1994 recommendations[7] regarding the need for improvements in immigration data collection, coordination, analysis, and dissemination. Although progress has been made, much more needs to be done. Reliable and timely data are crucial to the effective enforcement of immigration law. They are the basis for the effective implementation of ongoing and new programs. And, ultimately, they are the only means of assessing results achieved and reaching the conclusions necessary for responsible policymaking.

The Commission reiterates its 1994 recommendations regarding the need for improvments in immigration data collection, coordination, analysis, and dissemination.

Data problems throughout the immigration system have long been evident. The Panel on Immigration Statistics of the National Research Council concluded in 1985 that the "story" about immigrant data was "one of neglect."[8] Despite increases in congressional funding and some notable improvements at the INS, the available data remain incomplete—a problem that exists to some degree in each agency involved in the immigration system.

---

[7] U.S. Commission on Immigration Reform. 1994. *U.S. Immigration Policy: Restoring Credibility.* Washington, DC. 179-86.

The Commission believes there is a pressing need for improvements in immigration data collection, standardization, intra- and inter-agency linkages, timely dissemination, rigorous analysis, and use in policymaking. The Commission urges the federal government to support continuing research and evaluation on all aspects of immigration. Further, the Commission urges the Congress to insist upon the organizational structures needed to create and maintain high-quality statistical data.

The statistical function must be given high priority and sufficient institutional control and authority. Quality data do not evolve as a by-product of disjointed administrative data-gathering responsibilities. Quality data ultimately require a statistical system that can satisfy policy-relevant and management information needs through an integrated, centrally-coordinated approach.[9]

In recent years Congress has addressed the statistical problem by requiring improvements in specific arenas—primarily through automation—and by appropriating increased funding. These steps are encouraging and the Administration appears to have embarked successfully on some programs for automated data collection. The INS already has established separate systems for data collection and retrieval for its core enforcement and benefits functions.[10] Under the Commission's proposals it is essential that the statistical systems under DOJ enforcement and DOS benefits retain an automated and integrated design. However, statistical systems cannot be improved simply by automating data collection.

As the Panel on Immigrant Statistics concluded, it would be naive

[9] Norwood, J. L. 1995. *Organizing to Count: Change in the Federal Statistical System*. Washington, DC: The Urban Institute Press.

[10] However, there still remain more than one dozen separate data collection systems that often suffer from various internal deficiencies and remain to be integrated into larger core systems.

to assume that automation will solve the problems that have been evident for too long a time in statistical operations.[11] The Panel cited an agency-wide lack of understanding and commitment to high-quality data and the need for the development and acceptance of appropriate standards as the primary causes of today's inadequate state of affairs. It is necessary to change priorities from data collection solely for individual division administrative purposes to the production of data for integrated enforcement, benefits, quality control, and analytic uses.

Congress also has been critical of the way in which data has been disseminated. In the context of congressional debate, sporadic release of data has the potential for politicizing statistics. Regular and scheduled release of statistics, preferably monthly, can go a long way toward depoliticizing data and focusing attention on unbiased analysis. The Department of Labor's Bureau of Labor Statistics, with an autonomous and scheduled release of data, offers one model for the dissemination of data with no relation to the policy calendar.

The Commission believes each agency with immigration responsibilities should have a statistical office charged with final authority over data coordination, agency-wide definitions and systems integration, quality monitoring, research and analysis, and regular dissemination. Data collection and analysis must be a priority and be reflected in the statistical branch's organizational placement. Only sufficiently high placement and authority can ensure that its mission is successfully discharged.

Interagency cooperation and coordination of agencies that produce or use immigration data can enhance the data's timeliness and value significantly. Cooperation also can lead to significant gains in the

use of scarce resources—be they funding, staff, time, or public tolerance. Such coordination must insure monitoring of progress, adherence to standards, common definitions, timeliness in publication, and full disclosure of methods, methodology, procedures, and problems. Only then will significant improvements occur.

Consideration should be given to the creation of a *permanen*t taskforce on immigration statistics that would coordinate interagency efforts to improve all aspects of the statistical system. Various *ad hoc* and temporary governmental working groups have tackled a part of, or the whole of, the data collection system.[12] A formally-charged taskforce would craft the basis for interagency agreements and possible statutory and regulatory changes. To be effective, the taskforce would require appropriate institutional support. It would marshal interagency collaboration on data whenever feasible, especially on definitional issues and on what information is collected. The taskforce should conduct an exhaustive review of the data collected in each agency, identify overlap or potential interagency data linkages, evaluate technical and computer needs, propose standard definitions, and make recommendations.

Information Needs

Little can be done to make significant advances in our understanding of immigration without improvements in data and targeted research. Policymaking is particularly hampered by lack of knowledge from detailed surveys and longitudinal studies in three areas: the experiences and impacts of immigrants; the experiences and impacts of foreign students and foreign workers admitted for limited duration stays; and the patterns and impacts of unlawful mi-

[12] The INS has convened an Interagency Working Group on Immigration Statistics that has reviewed various data problems. It has had a significant impact on Administration funding for an immigration component in the Current Population Survey, the preeminent U.S. source of data on national trends and on the U.S. labor force. It also made significant contributions to ultimate Administration support for the New Immigrant Survey.

gration. There is a seemingly inexhaustible range of options for collecting data and, especially, topic areas needing research.[13] Examples of pressing analytic data needs are discussed below.

Legal Permanent Admissions

The gap between questions about legal immigration and the data needed for answers is greater than in almost any other area of public policy. It is not now possible to address fully pressing policy questions about the changing skill makeup of newly admitted immigrants over time, the transitions between temporary and permanent residence status, the effects of today's immigration on future demand through family reunification, and the success and impact of immigrants in the U.S. economy.

To answer such questions, policymakers have a crucial need for both data on detailed classes of admission and the capacity to track changes over time. Recently, the Administration funded the collection of data on immigrants in the monthly Current Population Survey. However, these and other survey data neither collect detailed information about status nor distinguish between legal and illegal foreign residents, much less between the various temporary or permanent admission statuses.

The INS yearly admissions data are the most immediate source of information on immigrant entry class. Yet, the data serve primarily as a minimalist administrative count of individuals. Identifying family units would make it possible to evaluate admissions as they really are: the immigration not of individuals but of families. The quality and type of data gathered on labor force status depends on definitions that do not conform with modern concepts. Including information about immigrant sponsors would go far to increase our

[13] Edmonston, B. (ed.). 1996. *Statistics on U.S. Immigration: An Assessment of Data Needs for Future Research*. Washington, DC: National Academy Press.

ability to make reliable forecasts about the numbers and skill composition of tomorrow's immigrants.

The New Immigrant Survey discussed in the introduction to this report demonstrates the policy value of expanded data on new admissions. For the first time we have an accurate picture of education and English ability, as well as the capability for studying transitions from temporary to permanent status, the characteristics of sponsors, and the financial well-being of new entrants. Designed as a pilot, the NIS should be seriously evaluated for its costs and for its value as a model for a longitudinal survey.[14] Experts agree that only a longitudinal survey ultimately can answer Congress' most pressing questions.[15]

Finally, it is essential to improve our knowledge of newly naturalizing citizens. In the past few years there have been dramatic increases in the numbers of persons naturalizing, but little is known about the individual circumstances under which residents choose to naturalize. Only more detailed knowledge about such things as eligibility and motivations will yield indicators to forecast the number of future applications. Accurate forecasts are needed to meet demand and to organize processing integrity.

---

[14] A longitudinal survey would, among other things, help address serious deficiencies due to "lost data sources." In the 1950s, the U.S. discontinued collecting data on persons leaving permanently. Without accurate emigration data, demographic estimates of the size and growth of the foreign population are imprecise exercises. In the 1980s, the "Alien Address" database was discontinued. Knowing the size of the legal population makes it possible to get significantly more precise estimates of the size and location of illegal residents.

Limited Duration Admissions

There exists remarkably little comprehensive or policy-relevant knowledge or research on the administration of the LDA system or its impact on the U.S. economy.[16] Problems in the LDA data system are even more pervasive than in the legal permanent system.

The Commission believes that improvements in data collection and analysis of LDAs and the impact of these admissions should be considered an urgent priority. The INS has made significant efforts to improve its data and has directed funds toward new computer systems. The Commission urges the Congress to support continued innovation in data collection and storage retrieval. As in our last report, the Commission suggests that building upon existing administrative recordkeeping will be most cost-effective.

Improved data and new research efforts are especially critical as there is remarkably little known about the number, characteristics, and impact of LDA workers and foreign students. For example, important basic information is lacking on LDA workers—their geographic location in the U.S., occupations, or labor-market effects. Longitudinal data and analysis are needed regarding the transition of LDA workers to immigrant status—directly or through other temporary categories. Likewise, little is known about the total population and characteristics of foreign students, their geographic distribution, academic status, duration of stay, employment activities, or change and adjustment of legal status.

There is a critical need to continue and extend improvements in departure data—one of the more crucial components of the entire immigrant information system. Precise exit information is necessary to track duration of stay, compliance with visa regulations, and overstays. Further, the utility of current data could be meaningfully

[16] Lowell, B.L. (ed.). 1996. *Temporary Migrants in the United States.* Washington, DC: U.S. Commission on Immigration Reform.

extended, for example, by collecting accurate information on intended destination. The Commission endorses continued emphasis on the improvement and introduction of electronic/paperless mechanisms for the collection of departure data.

Unauthorized Migration

The measurement and study of illegal aliens—a clandestine population—always has been fraught with difficulties. Ironically, a focus on estimates of this population may well have produced more accurate numbers than official figures on legal residents. Yet, if our research knowledge of legal immigrants is circumscribed, and research on LDAs nearly nonexistent, the analysis of the illegal population, while extensive, suffers from combinations of problems.

At a rudimentary level, there is a need to know more about the number of illegal aliens who entered without inspection [EWI] in contrast to temporary admittees who overstay the time permitted on their LDA visa.[17] In terms of enforcement efforts the distinction is important, but there is an unknown range of error in current estimates. What proportion fall into each type? Improvements in existing databases are sorely needed along with research into innovative and reliable means of estimating each population.

Much could be gained from knowing about the varied means by which EWIs and LDA overstayers come to the United States and the length of their stay. If, for example, LDA overstayers had shorter durations of residence in illegal status, then their proportion of the total illegal population is, in a sense, more "fluid." At a more critical extreme, subpopulations of highly mobile and circular mi-

[17] U.S. General Accounting Office. 1995. *Illegal Immigration: INS Overstay Estimation Methods Need Improvement.* GAO/PEMD-95-20. Washington, DC: U.S. Government Printing Office.

grants may stay for only short periods in the United States. These highly mobile individuals would not be fully captured in standard estimates of the illegal population.[18]

[18] There are few reliable estimates of the highly-mobile, illegal subpopulation, nevertheless, *ad hoc* estimates increasingly are heard. A correct estimate of this population should adjust for its average, or "person year," size. For example, if 100 illegal workers spent one-half year working in the United States, they would earn the yearly wages of 50 workers. See Heer, D.M. 1990. *Undocumented Mexicans in the United States*. Cambridge: Cambridge University Press.

CONCLUSION

This report concludes the work of the U.S. Commission on Immigration Reform. Together with our three interim reports, this final set of recommendations provides a framework for immigration and immigrant policy to serve our national interests today and in the years to come. The report outlines reforms that will enhance the benefits of legal immigration while mitigating potential harms, curb unlawful migration to this country, and structure and manage our immigration system to achieve all these goals. Most importantly, this report renews our call for a strong commitment to Americanization, the process by which immigrants become part of our community and we learn and adapt to their presence. Becoming an American is the theme of this report. Living up to American values and ideals is the challenge for us all.

APPENDIX A

IMMACT: PROVISIONS AND EFFECTS

The Immigration Act of 1990 [IMMACT] attempted to balance a number of competing interests. First, it established annual overall limits on total legal immigration, but allowed those limits to be "pierced" in response to changing levels of nuclear family applications and humanitarian admissions. Second, it created a guaranteed minimum number of visas for close family members if there are increases in the number of immediate relatives of U.S. citizens seeking entry. Third, it increased the number of persons admitted for employment reasons, with higher priority given to professionals and highly-skilled persons. Fourth, it created a diversity class of admissions for persons from nations that have not recently sent many immigrants to the United States.

IMMACT legislated a worldwide level of 675,000 family-based, employment-based, and diversity immigration admissions per year.[1] This ceiling may be pierced if immediate relative applications exceed expectations and does not include refugee, asylum, or other humanitarian admissions. The worldwide pierceable ceiling represented an increase of about 40 percent in the permitted number of admissions compared to previously legislated levels. Prior to IMMACT, immediate relatives (who entered without regard to numerical limits) averaged about 210,000 per year, and numerically-limited categories were set at 270,000. Humanitarian-based admissions were set outside of regular immigration ceilings, as they con-

[1] A transition worldwide level of 700,000 admissions was in effect during FY 1992-1994. Many admissions during the first two years were from the pre-IMMACT backlog and do not necessarily reflect the aims of the new legislation.

tinue to be under IMMACT. Most of IMMACT's legal immigration provisions went into effect in FY 1992, with the permanent diversity program beginning in FY 1995.

More specifically, IMMACT contained the following provisions affecting immigration numbers and immigrant characteristics.

Family-based admissions. IMMACT established a worldwide limit of 480,000 family-based admissions. Immediate relatives—including spouses, minor children, and parents of U.S. citizens—continue to enter without regard to numerical limits. Their actual admission numbers are subtracted from the worldwide limit to determine how many other family members (i.e., adult unmarried children of U.S. citizens, spouses and minor children of legal permanent residents, married children of U.S. citizens, and siblings of adult U.S. citizens) will be permitted to enter the following year. IMMACT set a minimum floor of 226,000 numerically-limited family immigrants. In addition, unused employment visas are transferred to the next year's family admissions.

The actual number of admission slots available and used each year varies. During the past five years, annual family admissions have been as low as 460,653 in FY 1995 and as high as 595,540 in FY 1996.[2] Variation can be seen in both the immediate relative and the numerically-limited categories.

---

[2] Processing problems explain some of the below average numbers for FY 1995 and above average ones for FY 1996. Higher demand for adjustment of status within the United States followed enactment of § 245(i) that permits those not in lawful status to pay a penalty to obtain their legal immigration status in the U.S. INS was not prepared for the large increase in applications, resulting in an adjustment backlog. Some of those who normally would have received their green card in FY 1995 had to wait until FY 1996. In the meantime, the large number of unused FY 1995 employment-based admissions were transferred to the family categories for FY 1996.

One goal of IMMACT was to reduce waiting times, particularly for the spouses and minor children of legal permanent residents (FB-2A Preference). Recognizing that the 2.7 million aliens who were given LPR status by the Immigration Reform and Control Act would petition for their immediate families, IMMACT provided three years of additional visas for spouses and minor children of legalized aliens. Because per-country limits sometimes create admission backlogs for affected nationalities, it also required that 75 percent of the FB-2A numbers would be exempt from per-country limits.

The family categories have attracted far more applicants than there are admission visas and, hence, large backlogs have developed. The total backlog of family applicants stood at 3.5 million at the start of FY 1997, essentially unchanged from FY 1996. About one million individuals are awaiting legal admission under FB-2A. As projected by the Commission in its 1995 report, the numbers on the FB-2A waiting list have declined slightly from the prior year.[3] However, the waiting time until admission has continued to grow since IMMACT. From an already long wait of just less than two and one-half years in FY 1992, the waiting time in the backlog has continued to increase each year until, at the time of this report, it is almost four and one-half years. The priority date for admission advances little each month, meaning longer and longer waits for new applicants. Anticipation of such trends led the Commission to recommend in its 1995 report a series of changes to the numerically-limited family categories, but no congressional action was taken. The Commission

[3] Much of the initial rapid increase in the spouse and children of the LPR backlog was due to IRCA legalization. Now most of those family members already have made their applications and, indeed, new applicant numbers have declined steadily since 1992. Even so, there were still 82,521 new applicants entering the backlog in 1996. In most years, about 90,000 admission slots are available for FB-2A, meaning that the waiting list will experience only modest decreases in the future.

has projected that waiting times could reach as long as ten years for applicants at the end of the waiting line.[4]

Employment-based admissions. IMMACT extensively revised the employment-based categories and numbers. The legislation emphasized the admission of high-skilled persons and added a new category for investors. IMMACT allows up to 140,000 employment-based admissions each year, up from an annual limit of 54,000 under previous statute. Covered under these numbers are the principal applicants, as well as their spouses and minor children (both referred to as beneficiaries). The numbers are distributed over several categories, generally reflecting educational and skill level. IMMACT also placed a cap of 10,000 admissions on lesser-skilled admissions.

Employment-based admissions increased significantly under IMMACT, but they have not approached the annual ceiling of 140,000 (except when the Chinese Student Protection Act of 1992 [CSPA] permitted Chinese who had entered the U.S. before Tiananmen Square to become permanent residents under the employment category). Subtracting out the onetime admissions under CSPA, skilled and unskilled employment-based admissions have gone from about 100,000 in FY 1994 to 81,000 in FY 1995 and back up to 117,000 in FY 1996. The increase in FY 1996 appears to reflect a catchup from

---

[4] In principle, the recent surge in the naturalization of potential sponsors could reduce the backlog and waiting time of spouses and children of LPRs. Sponsors who have naturalized can petition for the admission of their spouses and minor children under the unlimited citizen reunification category, thus effectively moving them out of the queue. However, this process will not decrease the backlog in an expeditious fashion. Even assuming rather high rates of naturalization, the Commission projections also show that it will take at least another decade before today's backlog can be reduced to acceptable numbers. Surprisingly, early indications are that the large volume of naturalizations since 1995 have not resulted in increases of relatives of U.S. citizens in the family preference total. (DOS Bureau of Consular Affairs. 1997. *Visa Bulletin* 73:7 A7.)

administrative processing delays in the previous year. The most notable increase through this period has been in the first preference, particularly in the subcategory for executives and managers of multinational corporations.[5] The first preference had fewer than 5,500 admissions in IMMACT's first year of implementation but now has more than 25,000 admissions.

In terms of the backlog of employment-based visas, the category of unskilled workers (EB-3B preference) remains heavily oversubscribed as of FY 1997, with nearly a seven-year wait for admission for all nations. Otherwise, only India is oversubscribed with nearly a two-year wait for admission for employment professionals with advanced degrees (EB-2) and skilled workers (EB-3A). Employment-based admissions must be closely monitored to know whether or not they reach their limit in the future and whether per-country limits impede timely entry of the highly-specialized workers who are genuinely needed by U.S. business.

Diversity admissions. The diversity immigrant provisions in IMMACT seek to increase national diversity in the immigrant population by widening access for immigrants from underrepresented countries whose citizens have neither strong family nor job ties to the United States. The permanent program began in October 1994. It provides 55,000 admission slots per year to nationals of countries that have sent fewer than 50,000 legal immigrants to this country over the previous five years. Each applicant must have a high school education or its equivalent or two years of work experience in an occupation requiring at least two years of training or experience. Persons eligible to enter are chosen by lottery. In FY 1996, some eight million applications were received by the Department of State.

---

[5] Multinational corporations include U.S.-based companies with overseas operations and large and small foreign businesses that establish U.S. offices, subsidiaries, or affiliates.

About 40,000 diversity immigrants entered in FY 1995 and 58,000 in FY 1996. As with other admission categories, the FY 1995 numbers are misleading because of the delays in processing adjustments of status. Unlike other categories, however, the diversity program does not permit a waiting list of unprocessed applicants who will be interviewed the following year.

Refugee and other humanitarian admissions. Various categories of people may obtain LPR status outside of the worldwide pierceable ceiling. The largest groups are refugees admitted from overseas as part of the refugee resettlement program and asylees granted asylum domestically. After one year, refugees and asylees become eligible to adjust to LPR status. They are counted when the adjustment occurs. Other humanitarian-based admissions include Amerasians, parolees permitted to adjust status under special legislation, and individuals granted suspension of deportation. The total numbers admitted under these categories vary depending largely on the annual refugee admission levels determined through Presidential-Congressional consultation. All humanitarian admissions reached a high in FY 1994 of 160,000 and dropped modestly to 123,000 and 138,000 in FYs 1995 and 1996, respectively.

Future trends. As indicated, the year-to-year admissions under IMMACT have followed an up-and-down course. Future trends are difficult to project. A number of factors may increase future admission levels. Given the pace with which immigrants are naturalizing, growth in the number of immediate relatives may occur as newly naturalized citizens petition for their families. While LPRs may petition for spouses and minor children, until naturalization, they may not petition for the admission of a parent. It is also unlikely that the numerically-limited family preferences will be undersubscribed in the foreseeable future. Continuing backlogs ensure that available family quotas, as well as any unused employment numbers transferred to the family categories, will be filled.

At the same time, new provisions adopted in the recent welfare reform (The Personal Responsibility and Work Opportunity Reconciliation Act of 1996) and the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 may dampen future admissions despite the lengthy waiting lists. In particular, IIRIRA requires all family members to be sponsored by a U.S. petitioner whose income meets at least 125 percent of the poverty level. Sponsors must sign legally-binding affidavits under which they pledge to provide any financial support needed by the new immigrants. In addition, the welfare reform legislation bars noncitizens from most income transfer programs. Some U.S. family members may be unwilling or unable to take on these new financial responsibilities for new immigrants.

APPENDIX B

STATEMENT OF COMMISSIONER WARREN R. LEIDEN

While I agree with most of the findings and recommendations of the Commission majority, there are two subjects of major recommendations on which I am moved to make separate statements —one in dissent (Legal Permanent Admissions) and one in concurrence (Structural Reform).

Legal Permanent Admissions

Legal immigration needs reform of priorities and allocations, but current levels of legal immigration are in the national interest. Virtually all the research and analysis received by the Commission indicated that the current levels of legal immigration continue to provide a net positive benefit to America in a multitude of ways. Whatever interest is examined—economic, social, political, scientific, or cultural—the current levels of legal immigration are found to benefit each of these aspects of American life. The current levels of legal immigration that were established by the Immigration Act of 1990 have served this country well. And, after the current one-time increase that is the result of the 1986 legalization program, the overall number of legal immigrant admissions can be expected to moderate and decrease.

The current overall levels of legal immigration should be maintained until there is another opportunity for review in three to five years.

The majority recommends a one-quarter reduction in legal immigration from current levels, but not now, rather in five to eight years.

This reduction comes at the expense of thousands of American families who have been patiently waiting for legal reunification with their close relatives overseas. It is accomplished by eliminating three of four family preference categories and simply shutting the door on thousands of sons, daughters, and siblings of U.S. citizens.

There is no convincing argument for this drastic reduction in legal immigration now or years from now. Current levels of legal immigration clearly serve the national interest and can better do so if priorities and allocations are reformed.

Prioritize family-based admissions without eliminating family **reunification.** Spouses and minor children of U.S. citizens and lawful permanent residents [LPRs] and parents of U.S. citizens should receive the highest priority for immigration, but this can be accomplished without eliminating the immigrant categories for adult sons and daughters or siblings of U.S. citizens.

The family preference categories should be reordered, placing the spouses and minor children of LPRs at the top, with a "spilldown" of unused visas going to the remaining family categories. This approach would ensure the quickest reduction in the shameful backlog of spouses and minor children of LPRs, without sacrificing the family unification of those sons and daughters who simply turned 21 years old. The majority, by its determination to reduce legal immigration, is forced to call for the elimination of sons and daughters preference categories. It is wholly unnecessary to impose this hardship when simple priority setting can accomplish the same end.

The backlog of spouses and children of LPRs has already begun to decrease, and there are fewer new applicants than there are individuals being accorded immigrant status under the "second preference category." This indicates, as predicted, that the current backlogs can be reduced and that a new stable level of family immigration can be achieved once the one-time "echo" of the legalization

program has been processed. The small increases in the family preference categories for sons and daughters can be quickly made up once the top preference category is current.

Preserve employment-based immigration levels and reform labor market tests without penalizing employers. I dissent from the majority's recommendation to reduce employment-based immigration by almost 30 percent to only 100,000 admissions per year (including spouses and children). This level was already exceeded in FY 1996, when employment based legal immigration reached 117,000. Moreover, the continued growth of the international economy promises to increase employment-based legal immigration up to at least the current level of 140,000 admissions per year. The majority's recommendation to cut annual employment based admissions down to 100,000 per year would result in immediate backlogs, which would recreate precisely the situation that the Immigration Act of 1990 was enacted to cure.

Proposals that would result in the immediate creation of new backlogs are clearly wrong. The employment-based immigration ceiling should be kept at the current level, with review in three to five years.

New requirements and procedures need to be developed to replace the labor certification process to test the *bona fides* of the petitioning employer's need and to avoid adverse effect on similar U.S. workers. I dissent from the majority's recommendation that the solution is that such employers be required to pay a "substantial fee" or tax for the privilege of sponsoring international personnel.

The "substantial fee" approach simply does not address the real issues. It substitutes a penalty on certain employers for an honest assessment of what is beneficial to the national interest and what is practical in an environment of heightened international competition. The majority wants to label the imposition of fees to be a use of

"market forces," but it is obvious that government-imposed tariffs and fees are the complete opposite of market forces. For the government to charge a substantial, arbitrarily-set fee that will be used for purposes other than expense of adjudication and processing the application would be more like a tax, the antithesis of market forces. The majority would not only impose a penalty fee but would also require such employers to meet subjective tests of eligibility, such as whether it took "appropriate steps to recruit U.S. workers." It is hard to imagine that this proposal would not result in a new bureaucracy sitting in judgment on employers' compliance with new regulations and requirements.

The majority's proposal will serve more to penalize U.S. employers who petition for international personnel than to prevent adverse effect. Unfortunately, a proper analysis of these issues and more thoughtful recommendations remain to be done.

Structural Reform

Restructure the federal immigration responsibilities to separate the adjudications function from the enforcement function but keep them in the Department of Justice along with the appeals function. The federal responsibilities to conduct immigration enforcement, both at the border and inside the U.S., and to adjudicate immigration and naturalization applications and petitions have not been managed adequately.

Although it has received substantial increases in appropriations for staff, equipment, and other resources, the enforcement function continues to suffer from a lack of strategic coordination. While important improvements have been made in enforcement at the border, coordination with interior enforcement is tactical at best and often exists in form only. Interior enforcement is led and managed by officials who have been charged with too many other responsibilities.

At most levels of the INS, inadequate attention is given to the glaring imbalances in staff and resource allocations to the sequential steps of the enforcement process so that the consequences of apprehension are neither swift nor certain. Distracted and overloaded management also increases the risk of error and misconduct by its subordinate staff. Simply put, there is not a single, focused, national chain of command to pursue an integrated national enforcement strategy, and the immigration function and the nation suffer as a result.

Similarly on the adjudications side, huge increases in fee account receipts have not resulted in proportional improvements in accuracy or efficiency. Managers at the local, regional, and national levels have not been adequately concentrated on their adjudications responsibilities in immigration and naturalization. The economies of scale and additional resources provided by the substantial caseload (and therefore revenue) increases have not been converted into improvements, rather there is the appearance that there is just too much to do.

The lack of success in enforcement and adjudications is not simply for want of trying. The immigration agencies are served by many talented and determined staff and managers. The current administration of the Immigration and Naturalization Service has made impressive strides forward on a number of fronts and its accomplishments are historic.

If, despite huge increases in funding and dedicated staff and leadership, the federal government still has not achieved adequate management of its immigration responsibilities, it is inescapable that something else must be done in order to arrive at a successful equation. Based on the information, interviews, and analyses the commission has reviewed over the past several years, it becomes an inescapable conclusion that the primary immigration functions need to be separated and restructured.

Separation of the enforcement and adjudications functions is the only solution to the current overload of responsibilities competing for attention that is obvious at every level of the INS. Separation of the functions would permit the establishment of unified, focused chains of command and operations at every level. Separation of enforcement from adjudications would allow each function to have a clear mission and to set clear goals on by which performance could be judged and accountability enforced. Separate functions would benefit greatly from the ability to gear hiring, training, promotions, and discipline to a clear mission.

At present, with its combined missions, the INS is often in internal contradiction, and its personnel, trained primarily in one mission or the other, are asked to crisscross from positions calling for one type of expertise and then the other. The most telling evidence of the value of separating the enforcement and adjudications functions comes the recent history of INS itself. The two most successful examples of INS adjudications programs, the 1986 Legalization program and the creation of an independent corps of asylum officers in 1990, are both instances where adjudications programs were consciously and deliberately kept separate and insulated from the enforcement mission of the INS. These practical, real world examples conclusively make the case for separation of enforcement from adjudications.

Of course, separation and restructuring of the immigration functions is not a panacea in and of itself. The combined missions are far from the only problem confronting the agencies, and the separation of the functions should be seen only as providing a necessary foundation from which real, lasting solutions can be hammered out to the many substantive challenges confronting the government. The substantive problems of operations and policy remain the fundamental issues of concern; structural changes provide means to better accomplishing these ends.

The benefits of restructuring can be gained with far less disruption, at less cost, and with greater chance of success if it is accomplished within the Department of Justice. The two main functions of the INS—enforcement and adjudications—should be separated into two different agencies within the Department of Justice, with separate leadership. This would also permit the insertion of a senior level office in the Department of Justice to coordinate and lead the separate functional agencies.

The creation of the Executive Office for Immigration Review [EOIR], which separated the immigration hearings and appeals function from the rest of INS in 1983, is a good model for this restructuring. Like the EOIR, each agency should have its separate mission, career paths, training, and management, while still benefiting from policy and strategic coordination at senior department level.

The Department of Justice is the proper place for the immigration enforcement function and it is the proper place for the adjudications function. The Department of Justice has long experience with and is the preeminent repository of expertise in both the immigration enforcement and adjudications functions. The Department of Justice epitomizes the values of due process and the rule of law, which are especially important in achieving effective enforcement and fair, accurate adjudications for a well-regulated, highly-selective legal immigration system. The division of these two immigration functions, within the Department of Justice, would be far less disruptive to either responsibility at a time when both adjudications workloads and the need for enforcement activities are at record levels.

In contrast, transferring the adjudications function to the Department of State would require it to integrate into its organization large operations programs with which it has little familiarity. Any department other than Justice would have to undertake the absorption of new missions, expertise, and institutional values with which it has little experience.

Keeping both functions within the Department of Justice would be far less costly than the transfer of all adjudications activities to the Department of State or another department. The personnel, training, facilities, and management are already fully part of and integrated into Department of Justice. Separation of enforcement and adjudications within the Department of Justice raises mostly issues of management and structure, rather the basic re-creation of a substantial institution in an entirely new setting.

Moreover, keeping adjudications within Justice would not require the proposed creation of an entirely new independent agency for immigration review in place of EOIR. There are substantive arguments on both sides of this issue, and it is one that should be decided on the basis of merit, not mandated simply due to interdepartmental restructuring.

As in all cases of organizational change, some predictable disruption and added expense are justifiable if the outcome is most likely to be an improvement. However, the consequences of the proposed transfer of all adjudications functions to the Department of State are far from certain. Unlike the Department of Justice, the Department of State would be undertaking a entirely different mission with which it has had little experience or interest. Historically, immigration and consular matters have received tertiary attention and status at the Department of State. It is a gamble to think that these longstanding attitudes will change for the better. While some argue that the Department of State could and should adopt an entirely new mission in the post-Cold War era, beginning this debate by making the massive implantation of the entire federal immigration adjudications function puts the horse before the cart and is a great risk to take.

The Department of State has not had experience with the large volume of substantive adjudications that heretofore have been done by the Department of Justice. Moreover, elementary concepts of

legal process, including administrative and judicial review, precedent decisions, and the right to counsel, have been vigorously resisted by the Department of State throughout its history of consular affairs. The Department of State has energetically fought all attempts in litigation and in legislation to make individual consular decisions subject to any review within the Department of State itself or by the federal courts. It is difficult for anyone familiar with this history to conceive that these Department of State traditions would soon give way to modern legal concepts and the consistency and accuracy that is their goal.

In contrast, the Department of Justice has the experience and the expertise. It needs only the restructuring and separation of enforcement from adjudications, with dedicated leadership and management for each, to have the best chance of success, at less cost and with less disruption of the fundamental immigration responsibilities.

U.S. COMMISSION ON IMMIGRATION REFORM

Created by the Immigration Act of 1990; Dissolved in December 31, 1997

MANDATE	**Congressional Authorization**
PEOPLE	**Commission Members** **Staff**
ACTIVITIES	**Reports to Congress** **Commission Research Papers** **Mexico-U.S. Binational Migration Study Report** **Binational Research Papers** **Congressional Testimony**

Last updated April 20, 1998.
